

What are the components of a lithium ion battery?

Battery mainly consists of four major components, which are cathodes, anodes, the electrolyte, and separators. Figure 1 shows the schematics of these components in conventional Li ion batteries (LIBs) and the movement of electrons, ions, and current flow under charging and discharging condition. Figure 1.

Why are aromatic compounds important in lithium-ion batteries?

Ever since lithium-ion batteries (LIBs) were successfully commercialized, aromatic compounds have attended every turning point in optimizing electrolytes, separators, and even electrode materials. However, the contribution of aromatic compounds has always been neglected compared to other advanced materials.

What are the different types of lithium compounds?

One of the most common lithium compounds is lithium carbonate, which is used in the production of lithium-ion batteries, ceramics, and glass. Lithium hydroxide is another important compound that is used in air purification systems, as well as in the production of lithium greases and lubricants.

How are lithium compounds formed?

Lithium compounds are formed by combining lithium with other elements, such as oxygen, sulfur, and chlorine, to form different chemical compounds. These compounds have a wide range of applications, including use in batteries, ceramics, glass, and pharmaceuticals.

Are carbonyl compounds a promising electrode material for lithium batteries?

To date, carbonyl compounds based on the conversion between $C=O$ and $C-OLi$ have been proven to be one of the most promising organic electrode materials for lithium batteries. Future works should pay more attention to the detection of redox intermediates through operando techniques and the further combination of theoretical calculations.

Which boron compounds can be used as additives in lithium-ion battery electrolytes?

Apart from the aforementioned boron-containing additives, there are other boron compounds that can be used as additives in lithium-ion battery electrolytes. In the study conducted by Gu et al., they introduced a cyclic boron-containing additive called 3-cyano-5-fluorophenylboronic acid (CFBA), which contains phenyl and $-CN$ groups.
