

Can a new battery packaging system solve "low specific energy"?

Conclusion In this study, a new battery packaging system is proposed for electric vehicles (EV) to resolve one of the major hindering factors in the development of EVs: "low specific energy". This battery packaging includes two types of multifunctional composites: structural battery composites (SBC) and microvascular composites (MVC).

What are the different types of battery packaging?

This battery packaging includes two types of multifunctional composites: structural battery composites (SBC) and microvascular composites (MVC). SBC shows promising potential in harvesting electrical energy in a form of chemical energy while providing mechanical integrity.

Does battery packaging design affect the driving range of an EV?

A parametric study is performed to evaluate the effect of each one of these design parameters on the driving range of an EV as well as overheating and structural integrity of battery packaging. The optimized battery packaging design obtained from the suggested optimization framework shows about a 23% increase in the driving range of Tesla model S.

What is SBC-MVC EV battery packaging?

MVC shows profound capability in providing thermal regulation for battery packs. In this packaging, SBC-MVC can be introduced in different parts of an EV (e.g. roof, hood, etc.) and these parts themselves can become lightweight batteries and provide a secondary source of energy for EVs.

What are the design parameters of a battery pack?

We consider several design parameters such as thickness and fiber directions in each lamina, volume fraction of fibers in the active materials, and number of microvascular composite panels required for thermal regulation of battery pack as design variables.

What is the objective function of SBC-MVC battery packaging?

The objective function is to maximize the driving range of an EV. Two constraints are considered for this design problem: (i) maximum allowable temperature of SBC-MVC battery packaging, and (ii) minimum allowable stiffness for SBC battery cells.
