This circuit can be used to charge Rechargeable 12V Lead Acid Batteries with a rating in the range of 1Ah to 7Ah. How to Recharge a Lead Acid Battery? Lead Acid Batteries are one of the oldest rechargeable batteries available today.

How to recharge a lead acid battery?

Terminals: Connect the battery to the external circuit. Figure 1: Lead Acid Battery. The battery cells in which the chemical action taking place is reversible are known as the lead acid battery cells. So it is possible to recharge a lead acid battery cell if it is in the discharged state.

How do lead acid batteries work?

In the charging process we have to pass a charging current through the cell in the opposite direction to that of the discharging current. The electrical energy is stored in the form of chemical form, when the charging current is passed, lead acid battery cells are capable of producing a large amount of energy.

What are the applications of lead - acid batteries?

Following are some of the important applications of lead - acid batteries : As standby units in the distribution network. In the Uninterrupted Power Supplies (UPS). In the telephone system. In the railway signaling. In the battery operated vehicles. In the automobiles for starting and lighting.

How do you wire a battery together?

There are two ways to wire batteries together, parallel and series. The illustrations below show how these set wiring variations can produce different voltage and amp hour outputs. In the graphics we've used sealed lead acid batteries but the concepts of how units are connected is true of all battery types.

How do you wire a battery in series?

For more information on wiring in series see [Connecting batteries in series](#), or our article on [building battery banks](#). The basic concept is that when connecting in parallel, you add the amp hour ratings of the batteries together, but the voltage remains the same. For example:
