

# Professional issues in the research and development of new energy batteries

Why should I publish with EES batteries?

As a gold open access journal, EES Batteries can maximise the potential and visibility of your publications. Our articles are free to read, access and cite by anyone around the world. We are also covering all article processing charges until mid-2027, so you can publish with us for free.

Why is EES batteries important?

Scientists all over the world are developing bigger and better batteries for a more sustainable future. Their work is crucial for us to drive our cars, store our energy and power our lives. EES Batteries is the home for this pivotal research. It is part of the EES family, which is known for delivering outstanding publications.

How many issues does EES batteries publish a year?

EES Batteries publishes 6 issues per year. Copyright is retained by authors when an open access licence is accepted, as with our standard licence to publish agreement. Full and accurate attribution to the original author is required for any re-use of the work. Find out more about copyright, licences and re-use permission.

What are the key research challenges in Metal-sulfur batteries?

Number of key research challenges such as the high reactivity of metallic anodes e.g., Li, Na, Mg, & Al and the solubility of sulfur species in the electrolyte are outstanding issues requiring further development work of metal-sulfur batteries.

Are EES batteries authors required to uphold the Royal Society of Chemistry's ethical standards?

EES Batteries authors, editors, reviewers and published works are required to uphold the Royal Society of Chemistry's ethical standards. The Royal Society of Chemistry is a member of the Committee on Publication Ethics (COPE) and our ethical standards follow COPE's core practices and best practice guidelines.

Why do we need a sustainable rechargeable battery policy?

Besides, a well-planned supporting policy could also increase the confidence of financial investors, driving more investment toward developing waste management industries or financing research activities that would boost the sustainability of rechargeable batteries.

Batteries have changed a lot in the past century, but there is still work to do. Improving this type of energy storage technology will have dramatic impacts on the way Americans travel and the ability to incorporate renewable energy into the nation's electric grid. On the transportation side, the Energy Department is working to reduce the costs and weight of electric vehicle batteries while ...

Lithium-metal batteries are desirable because they have the potential to hold substantially more energy than lithium-ion batteries of the same size -- and with a much faster charge time. But ...

# Professional issues in the research and development of new energy batteries

For example, Department of Energy (DOE) of the United States established Battery 500 consortium to support plug-in electric cars and aimed to achieve 500 Wh/kg in 2021; New Energy and Industrial Technology Development Organization (NEDO) of Japan released "Research and Development Initiative for Scientific Innovation of New Generation Battery" ...

R& D Item [1] Fluoride Battery Research and Development R& D Item [2] Zinc-Anode Battery Research and Development. Considering the achievements of the previous project (Development of Basic Technology to ...

The development and deployment of cost-effective and energy-efficient solutions for recycling end-of-life electric vehicle batteries is becoming increasingly urgent.

Lithium-ion batteries, known for their superior performance attributes such as fast charging rates and long operational lifespans, are widely utilized in the fields of new energy vehicles ...

Waste batteries can be utilized in a step-by-step manner, thus extending their life and maximizing their residual value, promoting the development of new energy, easing recycling pressure caused by the excessive number of waste batteries, and reducing the industrial cost of electric vehicles. The new energy vehicle industry will grow as a result.

Among electrochemical energy storage (EES) technologies, rechargeable batteries (RBs) and supercapacitors (SCs) are the two most desired candidates for powering a ...

We outline main challenges for future research in batteries, particularly, addressing the urgent needs of developing new environmentally-friendly material solutions to ...

Batteries research in Cambridge covers battery life, safety, energy & power density, reliability and recyclability of advanced batteries, supercapacitors and fuel cell type of batteries. Electrical vehicles (EVs) are vital in the transition to a zero-carbon economy. ... and new materials need to be identified. Research is also taking place on ...

9 ????&#0183; Nature Reviews Clean Technology is a new journal launching in 2025 that will publish Reviews, Perspectives, and opinion articles on the research, development, and ...

EES Batteries journal publishes exceptional research on batteries and energy storage. The journal is the home for this pivotal research and is part of the Energy & Environmental Science ...

By addressing the issues outlined in these principles through cutting-edge research and development, it is anticipated that battery sustainability, safety, and efficiency ...

## **Professional issues in the research and development of new energy batteries**

As mentioned in the previous section, Li-ion batteries (LIBs) are the dominant battery technology being utilized commercially today owing to their high energy densities and long cycle life [5]. The overall market scenario suggests that the Li-ion market will expand from \$30 billion to \$100 billion by 2025 [6]. However, despite their inherent benefits, Li-ion batteries face ...

As a crucial component of EVs, power batteries have become a core part of research and development in the growing market of NEVs. Current, weight, performance, storage capacity, and a lifetime of power batteries are key areas of research that are essential for the continued success of the NEVs market.

Flow batteries (FBs) have become a central topic recently, due to their promising prospect of addressing the issues of the random and intermittent nature of renewable energy sources. However, the successful industrialization of current FB systems is still limited by their relatively low energy densi ...
