

# Real attenuation test of new energy batteries

Is EV battery health attenuation law based on real-world EV data?

To overcome the shortcomings of above researches, this work investigates the health attenuation law of the battery pack based on real-world EV data. It aims to establish a SOH evaluation model for onboard applications and provide a theoretical basis for EV battery health management and maintenance.

How does aging battery affect capacity attenuation?

A large number of studies show that the charge-discharge ratio of aging battery is significantly higher than that of normal capacity battery. When the charge-discharge current and cut-off voltage exceed a certain threshold, the capacity attenuation accelerates.

Does the capacity attenuation rate of a lithium-ion battery increase or decrease?

The authors of [1] considered that the capacity attenuation rate of a lithium-ion battery is smaller when the average SOC is 50%. The average SOC value in a cycle interval is accelerated when the capacity attenuation rate is increased or decreased. However, SOC estimation methods rely on precise current measurements.

Does SoC depth affect battery capacity attenuation rate?

The authors of [2] through [3] indicate that the battery capacity attenuation rate increases with an increase of the SOC depth. The authors of [4] considered that the capacity attenuation rate of a lithium-ion battery is smaller when the average SOC is 50%.

How does charge-discharge ratio affect capacity attenuation of lithium battery?

The charge-discharge ratio has great influence on capacity attenuation of lithium battery. With the increase of charge-discharge ratio, the decline rate of the battery becomes faster. Reasonable control of the charge-discharge rate is an important guarantee of the battery's cycle service life.

What is the capacity attenuation model for accelerated aging tests?

Two important works for accelerated aging tests are establishing an accurate capacity attenuation model and determining the reasonable upper limit of the accelerated stress. These days, the empirical model for the capacity attenuation value is commonly used and is shown as function (1).

The data employed in this research was collected from the battery module of a fully electric bus line 18 in Hefei City between 2012 and 2013. This electric vehicle represents the world's first new energy bus route, which began on January 23, 2010. The battery module comprises 608 cells interconnected in parallel and series setups.

Lithium-ion batteries have broad application prospects, but the current methods for predicting the attenuation of lithium-ion batteries generally cannot meet the

Interest in the use of betavoltaic nuclear batteries has grown substantially in recent years for its potential use in new generation of microelectromechanical systems. Ni<sup>63</sup> is the promising because of: pure beta source, long half-life (about 100 years), and low energy beta particles. Temperature test up to 180 °C is mandatory for source validation.

Indeed, battery packs are crucial for new energy vehicles, as much as gearboxes for traditional fuel vehicles. At the same time, because most of our consumers' impressions and experience of batteries are derived from mobile phone batteries, and the attenuation of mobile phone batteries has been experienced by people, so some quasi-new ...

In the era of big data, using big data to realize the online estimation of battery SOH has become possible. Traditional solutions based on theoretical models cannot take ...

Lithium-ion battery is a complex thermoelectric coupling system, which has complicated internal reactions. It is difficult to investigate the aging mechanism due to the lack of direct observation of side reaction. In response, a method of aging mode identification based on open-circuit voltage matching analysis is proposed in this work. Firstly, the LiCoO<sub>2</sub> and graphite half cells are ...

The accelerated aging test method of multi-factor coupling can simulate the actual working conditions of the power batteries and obtain more real test data [16].

This aging modeling method is suitable for designing new packaging configuration, BMS and battery balance strategy through simulation; It is also used to monitor ...

Cycle life of power battery has a direct effect on the use of electric vehicles. This paper investigates the life prediction methods by inducing cycle life degradation model of power battery based on nickel-metal hydride batteries and manganese-based lithium ion batteries. Batteries were tested with reference of the test method of FreedomCAR, the U.S. Department of ...

Chinese battery giant Contemporary Amperex Technology Co Ltd (CATL, SHE: 300750) has launched its new energy storage system Tianheng to further tap the energy ...

For the purpose of this article, an acceleration model is devised for the valid period of capacity and the effect of temperature on lithium-ion batteries, revealing the pattern ...

This method requires new batteries' capacity degradation data from aging tests and the corresponding pulse test data. The pulse and corresponding capacity data are ...

Taking capacity as the health index is an intuitive and reliable method. Tian et al. [11] carried out battery

## **Real attenuation test of new energy batteries**

aging experiments with different charging rates, where battery capacity was calibrated at different cycles. The attenuation of battery power performance results from capacity decay and impedance growth [14].

Rechargeable batteries, which represent advanced energy storage technologies, are interconnected with renewable energy sources, new energy vehicles, energy interconnection and transmission, energy producers and sellers, and virtual electric fields to play a significant part in the Internet of Everything (a concept that refers to the connection of virtually everything in ...

Lithium-ion batteries (LIBs) are widely applied in diverse energy storage systems due to their high energy density, extended lifespan, low self-discharge rate, and lack of memory effect [1], [2]. Nonetheless, capacity and power degradation occur throughout their lifetime, limiting the operational lifespan of LIBs in practical applications [3] .

With the advantages of fast charging ability, high energy density, low self-discharge rate, no memory effect, and a long lifespan, lithium-ion batteries are widely used in new energy vehicles (EVs), communication facilities, electrical equipment in aeronautics, smart devices such as mobile phones, laptops, grids, etc. [1, 2].However, the battery"s capacity ...
