

# Types of organic cathode materials for lithium batteries

What are the different types of organic cathode materials?

Herein, the development history of the organic cathode materials and recent research developments are reviewed, introducing several categories of typical organic compounds as cathode materials for LIBs, including conductive polymers, organosulfur compounds, radical compounds, carbonyl compounds, and imine compounds.

Are organic cathode materials suitable for rechargeable lithium-ion batteries?

Organic cathode materials have attracted extensive research interest for rechargeable lithium-ion batteries (LIBs) because of their diverse structures and tunable properties. However, the preparation of organic cathode materials with high capacities, long cycling life, and high energy densities still remains a big challenge.

What types of cathode materials are used in LIBs?

Molecular structures of selected typical cathode materials for LIBs: a) conductive polymers, b) organosulfur compounds, c) free radical polymer compounds, d) organic carbonyl compounds, and e) organic imine compound. Structures of selected small molecular quinone cathode materials.

What materials are used to make a cathode?

Molecular structures of selected typical cathode materials for LIBs: a) conductive polymers, b) organosulfur compounds, c) free radical polymer compounds, d) organic carbonyl compounds, and e) organic imine compound.

Are organic cathode materials suitable for Lib applications?

In addition to inorganic cathodes, organic cathode materials have also been investigated as emerging materials for LIBs applications which follow Type B reaction like sulfur and iodine -based compounds, conductive polymer, oxygen-containing conjugated compounds and nitrogen oxygen free radical compounds [13,157].

What are the three types of organic carbonyl cathode materials?

Based on the molecular structures, organic carbonyl cathode materials can be divided into three major categories: quinone compounds, acid anhydrides, and imide compounds.
