What is the voltage of a CR2032 battery?

CR2032 batteries all nominally have a voltage of 3 volts, and open circuit voltages of approximately 3.6 volts. This can vary by brand, however, which is why we have provided datasheets for all of the major CR2032 brands in our datasheet section. What are CR2032 batteries used for?

Are all 2032 batteries the same?

Yes, all 2032 batteries are the same in terms of dimensions and voltage. But can vary in quality, chemistry, and actual capacity. CR2032 and BR2032 are two such 3V batteries available in these dimensions but differ in chemistry.

What if a CR2032 battery goes flat?

The voltage at which a CR2032 battery is considered flat, (or dead) lies between 2.7 - 2.8 volts. The CR2032 battery is a primary battery which means that it cannot be recharged. So, if the battery goes flat, it will need to be replaced with a new CR2032 battery. What is the full voltage of the CR2032?

Why is CR2032 a good battery?

While most of the batteries produce a nominal voltage of 1.5V, the nominal voltage of CR2032 is 3V. As these are small in size and produce high power, the weight-to-power ratio is also very high. The self-discharge tendency is also very low. Power stability is another celebrated characteristic. This is due to its low internal resistance.

How do I know if my CR2032 battery is healthy?

Common symptoms include your device not functioning properly, dimming displays, or the device completely turning off. For precise testing, you can use a multimeter to measure the battery's voltage; a healthy CR2032 typically shows around 3 volts. Can I recharge a CR2032 battery?
