

What is an aluminium electrolytic capacitor?

An aluminium electrolytic capacitor is composed of one anode of aluminium foil (or one aluminium foil anode) having a dielectric oxidation on its surface, with semiconductor characteristics to prevent the current flow in one direction, and another aluminium foil cathode.

Why do aluminum electrolytic capacitors have colossal capacitance?

Aluminum electrolytic capacitor construction delivers colossal capacitance because etching the foils can increase surface area more than 100 times and the aluminum-oxide dielectric is less than a micrometer thick. Thus the resulting capacitor has very large plate area and the plates are intensely close together.

Are aluminum electrolytic capacitors a good choice for high-end energy-efficient lighting?

Besides, the aluminum electrolytic capacitors for high-end energy-efficient lighting have been up to the world's advanced level. In 2018, China's demand for aluminum electrolytic capacitor stood at 171.9 billion units, a figure projected to rise to 276 billion units in 2025, expectedly showing a CAGR of 6.4% between 2018 and 2025.

Can aluminum electrolytic capacitors withstand overvoltage?

Aluminum electrolytic capacitors can generally withstand extreme overvoltage transients of limited energy. Application of overvoltage more than about 50 V beyond the capacitor's surge voltage rating causes high leakage current and a constant-voltage operating mode quite like the reverse conduction of a zener diode.

How long do aluminum electrolytic capacitors last?

The load life specifications for aluminum electrolytic capacitors operating at maximum permitted core temperature are typically 1000 to 10000 hours. That's a load life of six weeks to a year and a seventh and not long enough time for most applications.

What is a typical temperature range for aluminum electrolytic capacitors?

The typical temperature range for aluminum electrolytic capacitors is -40 °C to 85 °C or 105 °C. Capacitance varies about +5% -40% over the range with the capacitance loss all at cold temperatures. Capacitors rated -55 °C generally only have -10% to -20% capacitance loss at -40 °C.

Furthermore, aluminum solid electrolytic capacitors were fabricated using PEDOT:PSS as a cathode material. It was found that the electrical characteristics of the PEDOT:PSS aluminum solid electrolytic capacitors were optimized at pH 3, where D 50 and electrical conductivity played an important role for low equivalent series resistance (ESR) and high capacitance (Cap).
