

Can a capacitor replace a backup battery?

A large (0.1F) capacitor can replace your backup battery in certain applications. Though limited in storage capacity, the capacitor offers sufficient backup for low-dissipation equipment in which typical power outages last from a few seconds to several hours.

Can a supercapacitor be used as a backup power source?

However, supercapacitors can act as a backup power source without these limitations. Supercapacitors use physical charge storage, can be charged "instantaneously", with virtually unlimited cycle life, and their health is easily monitored. One important application is SSD backup.

What is a capacitor based backup system?

Capacitor based backup systems use a different methodology. Unlike battery based systems which provide continuous power during the entire backup time, capacitor based systems require only short-term backup power in order to transfer volatile data into flash memory or provide "dying gasp" alarm operation for a minimum necessary amount of time.

When should a backup capacitor be completed?

Since proper backup is not possible unless an adequate number of Joules are stored on the backup capacitor, many applications require that charging is completed by the time the system boots up and is ready for operation.

What is a supercapacitor and how does it work?

Supercapacitors can also support high power and be the energy store for a short duration maintenance free UPS supporting a server or multiple critical machines. The figure below shows CAP-XX's 1000F GE601 module can support 1000W of power for 50s until mains power or a backup generator cuts in.

What is the difference between a battery based and a capacitor based system?

While the backup power requirements of a capacitor based system are typically much higher than those of a battery based system, the backup energy requirements are generally much lower. Since the cost and size of a backup solution is usually dominated by the storage element, capacitor solutions are often smaller and cheaper.
