SOLAR PRO. Basic standards for low voltage capacitors

What is a low-voltage dry-type alternating current (AC) power capacitor?

This document provides standard requirements and general guidelines for the design, performance, testing and application of low-voltage dry-type alternating current (AC) power capacitors rated 1,000V or lower, and for connection to low-voltage distribution systems operating at a nominal frequency of 50Hz or 60Hz.

How is rated voltage applied to a capacitor?

For this purpose, the rated voltage is applied to the capacitors via a series resistance of approxi-mately 100 for VR 100 V DC, or 1000 for VR >100 V DC, for a period of one hour. Subsequently, the capacitors are stored under no-voltage conditions for 12 to 48 hours at a tem-perature between 15 and 35 °C.

What is the international standard for aluminum electrolytic capacitors?

The international standard for aluminum electrolytic capacitors is IEC 60384-4. The sectional specification mentioned above is complemented by a set of detail specifications that applies to specific design types (e.g. electrolytic capacitors with axial wire leads).

How much tolerance should a capacitor have?

A minimized tolerance (±0.35 mm) of the overall length 11 of the capacitor (figure 16) avoids un-wanted mechanical forces on the terminals, especially when several capacitors are mounted be-tween heat sink and bus bar.

What is a general-purpose grade aluminum electrolytic capacitor?

Aluminum electrolytic capacitors for general applicationsare called "General-Purpose Grade" (GP) in IEC publications. The international standard for aluminum electrolytic capacitors is IEC 60384-4.

What is rated voltage for aluminum electrolytic capacitors?

For aluminum electrolytic capacitors,rated voltages of 100 Vare usu-ally designated as "low voltage" and rated voltages >100 V as "high voltage". For details,refer to chapter "General technical information,15 Structure of the ordering code (part number)",page 39.
