

How to install a battery isolation system?

Step 1. FITTING The Isolator should be mounted directly to the vehicle's metal chassis close to the vehicle's battery but away from any high temperature sources. The Isolator should be mounted securely with unpainted screws/bolts to provide good electrical contact with the chassis.

How does a battery isolation unit work?

The unit will therefore instantly trigger into isolation mode when any of the kill buttons are struck or on detection of any break in switch wiring circuits such as during an accident. The Isolator also incorporates an LED which displays status as well as fault codes. Battery Isolators are designed for SAFETY and RELIABILITY. L = 92mm, W = 50mm.

What happens if the battery isolation is not installed correctly?

If not installed correctly then damage may occur to the Battery Isolator. The Battery Isolator **MUST** be fully connected before starting the engine. If the terminal marked 'FUEL or IGN' is not properly connected when the engine is running then damage to the Battery Isolator may occur. (Cars without alternators do not apply).

What is a battery isolation device?

This device contains no moving parts and the solid construction provides very high resistance to shock, vibration, water and dirt. Using the latest MOSFET technology this Battery Isolator provides safe, spark-free isolation of the vehicle's battery and engine electrics.

How do you control a battery Isolater?

The Battery Isolator can be controlled by any number of on-off/kill switches although the usual configuration is one internal on-off button and one external kill button. The internal switch needs to be of a latching type, either toggle or pushbutton, such that the ON position makes the circuit while the OFF position breaks the circuit.

Why does the battery Isolater automatically switch off if maximum temperature is exceeded?

The Battery Isolator will automatically switch OFF if maximum temperature is exceeded. This may occur after prolonged engine cranking or if the Battery Isolator is mounted close to a source of heat, e.g. engine, coolant pipes, exhaust, radiator fan, etc. Maximum current in POSITIVE circuit exceeded.
