

What is the basic principle of battery?

To understand the basic principle of battery properly, first, we should have some basic concept of electrolytes and electrons affinity. Actually, when two dissimilar metals are immersed in an electrolyte, there will be a potential difference produced between these metals.

How a battery works?

This electrical potential difference or emf can be utilized as a source of voltage in any electronics or electrical circuit. This is a general and basic principle of battery and this is how a battery works. All batteries cells are based only on this basic principle. Let's discuss one by one.

How does a battery convert chemical energy into electrical energy?

A battery is an electrochemical cell that converts chemical energy into electrical energy. It has two electrodes, with an electrolyte between them. At each electrode a half-cell electrochemical reaction takes place, as illustrated by the figure below. Electrode 1 is an anode: the electrode is oxidised, producing electrons.

What determines the basic properties of a battery?

The key components which determine many of the basic properties of the battery are the materials used for the electrode and electrolyte for both the oxidation and reduction reactions. The electrode is the physical location where the core of the redox reaction - the transfer of electrons - takes place.

What is a battery cell based on?

All batteries cells are based only on this basic principle. Let's discuss one by one. As we said earlier, Alessandro Volta developed the first battery cell, and this cell is popularly known as the simple voltaic cell. This type of simple cell can be created very easily. Take one container and fill it with diluted sulfuric acid as the electrolyte.

What are the components of a battery?

There are three main components of a battery: two terminals made of different chemicals (typically metals), the anode and the cathode; and the electrolyte, which separates these terminals. The electrolyte is a chemical medium that allows the flow of electrical charge between the cathode and anode.
