

How do battery conductance tests work?

Conductance test measurements can reliably track and predict the rate of battery degradation. Battery capacity (rated ampere hours) is the ability of the battery to deliver a given current for a given period of time ( $Ah = I \times t$ ). At present, the only way to determine a battery's actual capacity is by performing a true long duration load test.

What are the working principles of conductivity meters?

In this blog post, we will delve into the working principles of conductivity meters, exploring the electrochemical methods employed to measure the conductivity of electrolyte solutions. The method of measuring the conductance of the solution to be measured is called conductivity analysis.

Why is a battery conductance measurement important?

The resultant conductance measurement provides pertinent battery information without the need of bringing the battery to full discharge. As a battery discharges, its conductance and capacity are reduced with a simultaneous drop in power in a predictable manner due to the depletion of conductive active materials.

What is a conductivity meter?

Conductivity is the ability of a substance to carry electric current, as opposed to resistance, and its unit is cm. The working principle of the conductivity meter is shown in the figure. From Ohm's law we know:  $E_m = E R_m / (R_m + R_x) = E R_m \cdot (R_m + K_{cell} \cdot \kappa)^{-1}$ ;  $K_{cell}$  is the conductivity cell constant, and  $\kappa$  is the conductivity.

What is a conductance test?

Conductance test measurements become a valuable tool to identify the point at which the battery is approaching its end of service life. There is no direct correlation between conductance and the available capacity from a battery; hence a coefficient does not exist. As remaining battery life decreases, so does the conductance.

How do you determine a battery's conductance?

Initial conductance value for the most batteries can be provided by the battery manufacturer. If the batteries conductance value is not available it can be reasonably established by using the average of 20 to 30 measured conductance values provided they are the same type of battery, date code and state of charge.
