

What is the best packaging material for flexible batteries?

Packaging materials should be to be thin, lightweight, and soft. Since all components of flexible batteries are flexible, the packing coating should be flexible at the same level. Commonly, Al foil is used between plastic and flexible batteries to prevent air and moisture, but it is not flexible and thick, which limits energy density.

Are flexible/stretchable batteries a good packing material?

Up to now, various flexible and stretchable materials have been developed and widely used as packing materials for flexible/stretchable batteries, exhibiting good performances in mechanical performance while maintaining the good battery performance.

Why do we need packaging technologies for flexible/stretchable batteries?

Apart from the development of new and safer materials for various components of flexible/stretchable batteries, suitable packaging technologies have to be developed to prevent possible leakages of electrolytes under physical deformations.

Are flexible batteries a viable energy storage system for Future Electronics?

Flexible batteries have the potential to develop an ideal energy storage system for future electronics due to their advantages in safety, working temperature, high energy density, and packaging. The entire battery architecture must be transformed to design flexible batteries, including active materials, electrolyte, and separators.

What are the different types of flexible batteries?

This review discusses five distinct types of flexible batteries in detail about their configurations, recent research advancements, and practical applications, including flexible lithium-ion batteries, flexible sodium-ion batteries, flexible zinc-ion batteries, flexible lithium/sodium-air batteries, and flexible zinc/magnesium-air batteries.

How flexible materials are used in batteries?

To fulfill overall flexibility and agile deformation of batteries, various flexible materials are used in the substrate, package, and other components. One-dimensional fiber-shape structure and ultrathin flexible structure (UFS) are the most typical structures (Figures 2 A-2C).
