

Why should you install a battery system?

You won't get cut off from the world in case there is a power outage as you will have the battery system to be able to run your home for some time. This gives you energy security and peace of mind. Long-term cost savings- whilst they may not be cheap to install, they often pay for themselves over time.

Should a battery energy storage system be installed on an external wall?

If a battery energy storage system (BESS) is installed on the external wall of a building, it should not compromise the fire performance of the external wall. Service penetrations should be adequately fire-stopped, and internal combustible substrates should not be exposed by the installation.

How does a home battery storage system work?

Improve the use of your renewable energy - by incorporating a home battery storage system, you unlock the capability to capture renewable energy, preserving it for utilisation during periods of low energy production. This product empowers you to use more of your own solar energy.

Can a battery system be installed in a garage or outbuilding?

In general though we always recommend installing batteries and associated equipment inside a garage or outbuilding for the best solution for ongoing access and maintenance. Ideally, you will need a 2m wide x 2m high wall space to be able to fit the battery system at your home.

What are the benefits of a battery system?

You can even earn money from a battery system by gathering unused energy and giving it back to the grid at peak times. Another more obvious benefit is helping to reduce your carbon footprint and harnessing renewable energy will help reduce your household greenhouse gas emissions and help minimise your impact on our planet.

Do I need a supplementary charge before installing a battery?

Measure the battery open circuit terminal voltage which should be ≥ 2.1 volts/cell (12.6 volts for a 6 cell battery). If any batteries are lower they will need a supplementary charge prior to installation. To ensure maximum service life a supplementary charge may be required prior to installation. Apply a supplementary charge if:

only with a damp cotton cloth. Check monthly that total voltage at battery terminals, while on float, is (N x 2.25 to 2.28 V) for a temperature of 77°F (25°C), (where N is the number of cells in the battery). Upon initial installation, the battery unit date codes and installation date should be recorded. In addition, individual battery unit

Battery Overcharging: Battery overcharging can result in excessive production of gas and heat. This can cause the battery acid to evaporate, resulting in corrosion on the terminals. According to the Battery Products Service (2020), maintaining proper charging levels can significantly reduce the risk of corrosion. **Environmental Factors:**

This effect can lead to a battery "remembering" a lower capacity level if routinely charged before fully discharging. Various studies, such as those conducted by the Journal of Power Sources in 2019, indicate that lithium-ion batteries typically do not suffer significantly from this effect, but it can still occur under specific conditions.

Installation costs can vary based on whether you choose professional services or install the battery yourself. Professional installation may cost between \$50 to \$150. Many auto shops also provide guarantees for their work, which can lead to additional savings in the long run. DIY installation can save money but may require specific tools and ...
