

What is a lean electrolyte design?

A lean electrolyte design is one of the central aims of current research on lithium metal batteries (LMBs) based on liquid electrolytes because of its high impact on augmenting a gravimetric energy density.

What is the rational design of lean electrolyte Li-S batteries?

In response to the above issues, the rational design of lean electrolyte Li-S batteries focuses on: (1) building composite-based cathodes incorporating a conductive, high surface area and highly porous carbon framework.

Are lean-electrolyte conditions suitable for Li metal batteries?

Lean-electrolyte conditions are highly pursued for practical lithium (Li) metal batteries. The previous studies on the Li metal anodes, in general, exhibited good stability with a large excess of electrolyte. However, the targeted design of Li hosts under relatively low electrolyte conditions has been rarely studied so far.

Can lean electrolyte LSBs be used as a secondary battery?

Perspectives of future work on lean electrolyte LSBs was also presented. Lithium-sulfur batteries (LSBs) have attracted considerable attention as next-generation secondary battery due to their significantly higher theoretical energy density ($2,600 \text{ Wh kg}^{-1}$) compared to that of commercialized lithium-ion batteries (LIBs).

Is a 'lean-solvent' battery safe and cyclable?

Recent studies have underscored that minimizing the liquid solvent content below 20 wt% can improve battery safety and cyclability. Unfortunately, this emerging "lean-solvent" system is often, and somewhat misleadingly, categorized under all-solid electrolytes, thereby obscuring the presence of liquid components.

How to achieve a lean electrolyte LMB?

Electrolyte design is the major approach to achieve lean electrolyte LMBs. Electrode and interface design for lean electrolyte LMBs have been rarely published despite their importance. Considering the failure mechanisms under lean electrolyte condition and previous research, the following approaches are suggested for future advances. Table 1.
