

What is pulse charge & discharge principle?

A. Pulse charge/discharge principle The concept of pulse charging is based on successive changes in current rate and/or direction rather than using a constant charging current. Basically, the current can either be interrupted, introducing a shorter rest period, or replaced by a Impact of periodic current pulses on Li-ion battery performance

Does pulse discharge affect battery performance?

In addition, other works showed that pulse discharge was detrimental to battery performance mainly due to the fact that the peak currents cause transients on the cell's voltage that may be interpreted by the voltage cut-off circuit as an end-of-charge/discharge voltage .

Can a pulse discharge test a battery?

One recently introduced method [45] uses an acoustic wave passing through a battery to evaluate structure and SOC. In contrast, the results of this work demonstrate that a pulse discharge method can effectively match the ending SOC and isolate individual overvoltages within a battery.

How does pulse charging work?

Large pulse discharging current shortens battery charging time at low temperature. Pulse charging helps even the lithium distribution inside the battery. Pulse charging is a technique that charges a battery using a current that periodically changes in direction, potentially reducing battery charging time while improving its charging performance.

Can pulse charging improve battery performance?

Pulse charging can improve battery performance in several ways. Firstly, in low-temperature environments, the pulse-charging method can effectively preheat the battery. Some specific pulse parameters, such as cut-off voltage and pulse frequency, have been studied, revealing their impact on the preheating effect, and temperature rise .

What is a pulse charging method?

The concept of the pulse charging method is to disrupt the constant charge current rate and direction, thereby improving the performance of the battery by changing the current magnitude, current direction, or even temporarily halting charging [,,].

The amplitude of pulse discharge gradually increases from 0C to 5C, where the pulse time within each pulse duration has been adjusted to ensure 1 C equivalent charging ...

The positive sheets of the retired lithium-ion battery were used as the loads to conduct pulse discharge experiments at different voltages. Based on the voltage and current ...

We conducted 10-second pulse tests on the battery at 50 % SOC and 80 % SOC with discharge rates of 0.5C, 1C, 2C, and 3C. The polarization voltage during the pulse ...

Future studies will explore the effect of higher discharge frequency on battery heating, conduct more in-depth research on the impact of pulse discharge on battery health ...

pulse discharge data for Li polymer battery ranging from 0. ... strategies can effectively alleviate the capacity fade of the LFP batteries due to the relaxation process in the ...

In the actual working process of lithium ion battery, its internal chemical reaction is very complex ... pulse discharge is carried out on the fully charged battery. Each pulse ...

Simulate the battery pulse discharge by changing the battery operating conditions each time after running the calculation for five minutes. In the Run ... Short treatment can only capture the ...

I am using the battery discharge pulse analysis described in the link below to analyze the discharge of my batteries. Works great with discharge only pulses! ... This step will ...

A preliminary evaluation of an all-solid-state, polymer electrolyte-based, rechargeable lithium battery technology has been undertaken, in terms of its performance ...

Qu et al. [29] designed a circuit to conduct the pulsed discharge operation. Their results showed that the pulse-discharge heating process increased the battery ...

In summary, pulse charging a car battery usually takes between 30 minutes to several hours, depending on various factors, including battery type, discharge level, and ...

Pulse repair battery chargers offer improved charging efficiency. They can desulfate a battery and restore lost capacity. The chargers work by applying a maintenance ...

The energy loss rate during the charge process decreases with decreasing temperature, as there is insufficient time for the concentration profile generated by the ...

battery in 1 hour. For a battery with a capacity of 100 Amp-hrs, this equates to a discharge current of 100 Amps. A 5C rate for this battery would be 500 Amps, and a C/2 rate would be 50 Amps. ...

Herein, by integrating regular real-time current short pulse tests with data-driven Gaussian process regression algorithm, an efficient battery estimation has been successfully ...

Pulse charging works by applying short bursts of high voltage to the battery. This process can help break

down lead sulfate crystals that accumulate on the battery plates ...
