Can low-temperature lithium-ion batteries be managed?

Feasible solutions for low-temperature kinetics have been introduced. Battery management of low-temperature lithium-ion batteries is discussed. Lithium-ion batteries (LIBs) play a vital role in portable electronic products, transportation and large-scale energy storage.

Can high-throughput experiments be used in the research of low-temperature batteries?

Although many efforts have been made in the research of low-temperature batteries, some studies are scattered and cannot provide systematic solutions. In the future study, high-throughput experiments can be used to screen materials and electrolytes suitable for low-temperature batteries.

Can Li stabilizing strategies be used in low-temperature batteries?

The Li stabilizing strategies including artificial SEI, alloying, and current collector/host modification are promising for application in the low-temperature batteries. However, expeditions on such aspects are presently limited, with numerous efforts being devoted to electrolyte designs. 3.3.1. Interfacial regulation and alloying

How does low temperature affect battery performance?

At low temperature, the high desolvation energy and low ionic conductivity of the bulk electrolyte limit the low-temperature performance of the LMBs. Such processes play important roles in deciding the low-temperature performances of batteries.

How solvation structure affect low-temperature battery cycling?

Adjusting the solvation structure is also an effective strategy for low-temperature LMBs. In addition to the type and proportion of solvents, the intricate interactions among solvents, Li salts, and additives are also of great significance to the low-temperature battery cycling.

Why do batteries need a low temperature?

However, faced with diverse scenarios and harsh working conditions (e.g., low temperature), the successful operation of batteries suffers great challenges. At low temperature, the increased viscosity of electrolyte leads to the poor wetting of batteries and sluggish transportation of Li-ion ( $\text{Li}^+$ ) in bulk electrolyte.
