

How to replace a faulty semi-hot standby SM?

In the state of the SM failure, the capacitor of the semi-hot standby SM needs to be recharged to the rated value to replace the faulty SM and the capacitor of the cold standby needs to be charged to replace the used semi-hot standby SM.

What is cold standby vs hot standby?

The cold standby components do not fail until switched on [ 5 ]. Compared with the hot standby, cold standby takes lower cost but longer recovery time while the hot standby may cause more energy consumption [ 7 ]. To balance the system economical efficiency and the recovery time, warm standby rises.

What is the difference between operation status and hot standby state?

Operation status: It means that the isolating switch and circuit breaker of the electrical equipment are in the closed state and have voltage. Hot standby state: It means that the electrical equipment has the power transmission condition and the starting condition, and the circuit breaker is turned into the running state once it is closed.

What is a hot standby state?

Hot standby state: It means that the electrical equipment has the power transmission condition and the starting condition, and the circuit breaker is turned into the running state once it is closed. When the electrical equipment is in a hot standby state, the possibility of incoming calls at any time shall be regarded as live equipment.

How can a semi-hot standby SM reduce the loss of redundant SM?

To reduce the loss of redundant SM, a semi-hot standby SM is proposed in Ref. . In the normal working condition, the semi-hot standby SM is controlled in a range value. When one SM failure, the semi-hot standby SM will recharge to the rated value to replace the faulty SM.

What is hot vs cold standby redundancy?

Arbitrary time to failure distributions of elements are taken into account. An optimization hot vs. cold standby problem is formulated and solved. Sequencing of standby elements and choice of standby modes are optimized. It is well recognized that using the hot standby redundancy provides fast restoration in the case of failures.
