How to choose a metallized film capacitor?

struction. Here's how to choose. For a metallized film capacitor, the capacitor plates are aluminum sprayed onto the dielectric fi m by thin-film vacu-um deposition. Compared to making the capacitor with sep-arate foil and film sheets, met-allizing enables smaller size, lighter weight, lower cost per microfarad and self-healing, but it also

What humidity is required for a film capacitor?

humidity of 50 % ± 2 % are mandatory. Regarding solderability, our products comply with "IEC 60384-1" and the additional type specifications. For all capacitors, we refer to the paragraph "Soldering Conditions" in the type specifications. For more detail, we refer to the document "Soldering Guidelines for Film Capacitors":

How can film capacitors be optimized?

Film capacitors can be optimized through diferent materials and manufacturing methods. Capacitors are all unique; their fundamentals, the manufacturing processes, advantages and even technology trends are worth highlighting. There are different grades and applications critical to considering before choosing the best option.

Which film material is used in the production of Vishay film capacitors?

Vishay film capacitors uses the following film materials in their production: Polyester filmoffers a high dielectric constant, and a high dielectric strength. It has further excellent self-healing properties and good temperature stability. The temperature coefficient of the material is positive.

What happens if a metallized film capacitor is over withstand voltage?

*) In case of the metallized film capacitors (evaporated metal electrode type), if voltage in excess of the withstand voltage (or apparently in excess of the withstand voltage due to the lowering of withstand voltage) is applied, self-healing will happen continuously.

How reliable are film capacitors?

The most important reliability feature of film capacitors is their self-healing capability, i.e. their abil-ity to clear faults (such as pores or impurities in the film) under the influence of a voltage. The metal coatings, vacuum-deposited directly onto the plastic film, are only 20 ... 50 nm thick.

Changing the metallized electrode thickness alters the properties of the capacitor. Lighter metallization, higher ohms per square, result in higher energy density designs.

The temperature variation property of the AD PLZT film capacitor satisfies the X8R rating requirement (-55/+150, ?C/C = ±15%) as highlighted by the shaded area shown in the figure inset; this again
