

What is a chemically self-charging aqueous Zn-organic battery?

Accordingly, we design a chemically self-charging aqueous Zn-organic battery. Benefiting from the excellent self-rechargeability, the organic cathode exhibits an accumulated capacity of 16264 mAh g⁻¹, which enables the Zn-organic battery to show a record high energy density of 625.5 Wh kg⁻¹. Do chemically self-charging zinc-ion batteries work?

Impressively, such chemically self-charging zinc-ion batteries can also work well at chemical or/and galvanostatic charging hybrid modes. This work not only provides a route to design chemically self-charging energy storage, but also broadens the horizons of aqueous zinc-ion batteries.

Are aqueous zinc batteries self-charging?

In order to cope with harsh situations without an external power supply, developing high-performance aqueous zinc batteries (AZBs) with chemically self-charging as a self-powered system is of great practical significance.

How do chemically self-charging ZIB batteries work?

In addition, such chemically self-charging ZIBs can work at multiple charge/discharge modes. When they are chemically charged, the OCV slowly reaches ~0.77 V (Fig. 5b, Supplementary Fig. 28). After the batteries are exhausted, they can be chemically recharged again.

Can self-charging power systems recharge commercial batteries?

The recharging and reuse of commercial batteries is often limited in the harsh environment or remote area, where electrical grid is unavailable. Therefore, self-charging power systems that integrate energy harvesting devices and batteries together must be considered.

Can flexible aqueous Zn//HTAQ battery be chemically self-recharged?

Obviously, the above results show that the discharged flexible aqueous Zn//HTAQ battery can be chemically self-recharged via O₂ from air, meaning this battery has air-rechargeability.

The aqueous self-charging battery strategy induced by carbonate anion, as proposed in this study, holds the potential for extending to various anionic systems, including seawater-based Cl⁻...

Here the authors report an aqueous Zn-ion battery that can be self-recharged by the spontaneous redox reaction between cathode and oxygen from ambient environment without external power supply.

A chemically self-charging aqueous zinc-ion battery Yan Zhang¹, Fang Wan¹, Shuo Huang¹, Shuai Wang¹, Zhiqiang Niu¹ & Jun Chen¹ ... Chemical energy stored in molecules is an available energy

Battery Based on VO₂ Cathode and Polyacrylamide-Chitin ... term galvanostatic discharging/chemical self-charging cycling performance. Furthermore, a chemically self-charging flexible

This limitation exists because a battery stores energy in a chemical form and cannot convert that energy back into electrical energy without an external input. The process of charging involves moving electrons from the charger to the battery. ... A study by Lee et al. (2020) identifies a variety of self-charging battery technologies, including ...

The exhausted flexible Zn//HTAQ AZB after air-charging for 30 h, can present a high discharge capacity of 294 mAh/g at 0.5 A/g, a higher self-charging cycle stability (15 cycles), a high-rate capability, and work well at hybrid ...

Self-charging aqueous metal-based batteries are attracting extensive attention for use in energy conversion and storage technologies. However, they are constrained to the chemically self-charging mode by oxygen gas (O₂) ...

This minireview introduced the general self-charge mechanisms and summarizes the recent advances of various chemically self-charged ...

In order to allow oxygen in the air to enter the electrolyte of the flexible battery during the chemical self-charging process, an appropriate number of holes were previously drilled on the sealed membrane of the cathode for the flexible battery. Before starting the chemical self-charging process, we sealed the battery with a ...

For a practical self-charging zinc-organic battery, a fast air-charging rate and a high areal capacity of the cathode are two important factors. A scenario of field application is that, the exhausted battery can be fast charged via air-oxidation, then resume its power supply function. ... the faster the chemical reaction. Therefore, the ...

Self-charging battery systems could circumvent the reliance on charged batteries and intermittent sources of power by providing an emergency source of power that can ...

Chemical Science. Self-powered ... leading to the fast self-charging and high power density (maximum power density of 13.34 mW cm⁻², about two to three orders of magnitude larger than previous bio-fuel cells) of the Mg/PB battery. ...

Impressively, such chemically self-charging zinc-ion batteries can also work well at chemical or/and galvanostatic charging hybrid modes. This work not only provides a route to design ...

Herein, a novel chemical self-charging aqueous zinc ion battery (CSCAZIB) with a two-electrode structure is reported. In such a self-powered system, the discharged cathode and oxygen in ...

Accordingly, we design a chemically self-charging aqueous Zn-organic battery. Benefiting from the excellent self-rechargeability, the organic cathode exhibits an ...

Herein, a novel chemical self-charging aqueous zinc ion battery (CSCAZIB) with a two-electrode structure is reported. In such a self-powered system, the discharged cathode and oxygen in air will undergo spontaneous redox ...
