

Are metalized film capacitors a good choice for liquid impregnant capacitors?

To achieve such performances, metalized film capacitors (MFC) are adopted. Comparing with conventional liquid impregnant capacitors, the high energy density of MFCs is derived from the self-healing properties of metalized film.

What is a metalized film capacitor (MFC)?

for further information and to change your choices. Metalized film capacitors (MFC) are widely applied in power system, military weapons and railway traffics, etc. The lifetime of MFC is closely related to the self-healing (SH) process, which causes the loss of electrode area and thus leads to the capacitance reduction.

What is the rated voltage of a DC-link capacitor?

The thickness of the base films was 6×10^{-3} m, and the square resistance of the metalized films was $30 \Omega/\square$. The elements were aged under DC voltages of 1.4 UN, 1.5 UN, 1.6 UN and 1.7 UN, abbreviated as C1, C2, C3 and C4 respectively, where the UN was the rated voltage of DC-link capacitors that was 2900 V in the present study.

What is the rated field of DC-link capacitors in VSC-HVDC?

For instance, the rated field of DC-link capacitors in VSC-HVDC can be more than 200 kV/mm, almost three times higher than shunt capacitors and twice higher than DC filter capacitors. To achieve such performances, metalized film capacitors (MFC) are adopted.

What are the characteristics of a capacitor?

They are Low ESR, high ripple current handling capabilities, low inductance, self-healing property, long lifetime and etc. Capacitors are devices which store electrical charge. They are a basic component of electronics and have a host of various applications.
