

Comparison of economics of large-scale energy storage

What is a large-scale energy storage system?

Pumped-hydro energy storage (PHES) plants with capacities ranging from several MW to GW and reasonably high power efficiencies of over 80% [4,5] are well-established long-term energy storage systems. Compressed air energy storage is another widely established large-scale EES alternative (CAES).

Is there a financial comparison between energy storage systems?

There is a scarcity of financial analysis literature for all energy storage technologies, and no explicit financial comparison exists between different energy storage systems. Current studies are simplistic and do not take into consideration important factors like debt term and financing sources.

Which energy storage option is most cost-effective?

The application analysis reveals that battery energy storage is the most cost-effective choice for durations of ≤ 2 h, while thermal energy storage is competitive for durations of 2.3-8 h. Pumped hydro storage and compressed-air energy storage emerges as the superior options for durations exceeding 8 h.

Is thermal energy storage a cost-effective choice?

Sensitivity analysis reveals the possible impact on economic performance under conditions of near-future technological progress. The application analysis reveals that battery energy storage is the most cost-effective choice for durations of ≤ 2 h, while thermal energy storage is competitive for durations of 2.3-8 h.

Are energy storage technologies economically viable?

Through a comparative analysis of different energy storage technologies in various time scale scenarios, we identify diverse economically viable options. Sensitivity analysis reveals the possible impact on economic performance under conditions of near-future technological progress.

Which energy storage technology has the best economic performance?

When the storage duration is 1 day, thermal energy storage exhibits the best economic performance among all energy storage technologies, with a cost of < 0.4 CNY/kWh. Even with increased storage durations, the economic performance of TES and CAES remains considerable. Fig. 8. Economic performance under the day-level energy storage scenario.
