What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

Are battery storage costs based on long-term planning models?

Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs.

What is a fixed charge rate for lithium ion batteries?

Energy Economics. 31,269-277. 65 Assuming a 5% interest rate a 30-year finance period produces a 9.6% fixed charge rate. Li-ion batteries represent about 99% of all stationary storage being deployed in recent years, and more than 90% of these batteries have durations of 4 hours or less.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

Can lithium-ion battery storage stabilize wind/solar & nuclear?

In sum, the actionable solution appears to be ~8 h of LIB storage stabilizing wind/solar + nuclear with heat storage, with the legacy fossil fuel systems as backup power (Figure 1). Schematic of sustainable energy production with 8 h of lithium-ion battery (LIB) storage. LiFePO<sub>4</sub> // graphite (LFP) cells have an energy density of 160 Wh/kg (cell).

Will a fifth hour of battery storage cost more than 4 hours?

value for a fifth hour of storage (using historical market data) is less than most estimates for the annualized cost of adding Li-ion battery capacity, at least at current costs.<sup>25</sup> As a result, moving beyond 4-hour Li-ion will likely require a change in both the value proposition and storage costs, discussed in the following sections.

Electrochemical energy storage technology has been widely used in grid-scale energy storage to facilitate renewable energy absorption and peak (frequency) modulation [1]. ...
