

Why should thermal energy storage systems be integrated?

These overarching targets can be supported by the integration of thermal energy storage systems in order to increase utilization of renewable energy technologies (including solar thermal technologies as well as fluctuating power generation by PV and wind) and boost energy system flexibility through peak shaving and demand response applications

Where is energy storage research carried out?

Energy Storage research within the energy initiative is carried out across a number of departments and research groups at the University of Cambridge. There are also national hubs including the Energy Storage Research Network and the Faraday Institute with Cambridge leading on the battery degradation project.

Which DLR institutes are researching and developing electrochemical storage systems?

Various DLR institutes are researching and developing electrochemical storage systems for electricity (batteries) and thermal and thermochemical storage systems for heat. The majority of the work is being carried out at the DLR Institute of Engineering Thermodynamics.

What does the DLR Institute of Engineering Thermodynamics do?

The DLR Institute of Engineering Thermodynamics in particular is dedicated to these approaches. The focus is on the storage of high-temperature heat between 100 and 1000 degrees Celsius, which is needed for industrial and energy-sector applications.

How is heat stored?

Heat can be stored purely physically in the form of sensible heat (temperature difference), latent heat (phase change energy) and through the use of reversible chemical reactions (reaction energy). The DLR Institute of Engineering Thermodynamics in particular is dedicated to these approaches.

What is the Energy Storage Summit?

The Summit will highlight the fundamental role that energy storage will play in this journey, and will strive to recognise, explore and analyse key challenges that may present themselves on the trajectory ahead. The Summit will be a major networking event, bringing together over 2,000 stakeholders from across the energy storage value chain.
