

Does cell-to-cell capacity inconsistency exist in a battery pack?

Due to the initial and dynamic differences of battery cells, cell-to-cell capacity inconsistency exists in a battery pack. Considering the difference between the laboratory data and the operation data, this paper studies the battery pack capacity inconsistency of an electric vehicle based on cloud data.

What is cell inconsistency in a lithium-ion battery pack?

Abstract: Cell inconsistency is a common problem in the charging and discharging of lithium-ion battery (LIB) packs that degrades the battery life. In situ, real-time data can be obtained from the battery energy storage system (BESS) of an electric boat through telemetry.

How does inconsistency affect a battery pack?

Battery packs are applied in various areas (e.g., electric vehicles, energy storage, space, mining, etc.), which requires the state of health (SOH) to be accurately estimated. Inconsistency, also known as cell variation, is considered a significant evaluation index that greatly affects the degradation of battery pack.

Is battery pack capacity inconsistency based on cloud data?

Considering the difference between the laboratory data and the operation data, this paper studies the battery pack capacity inconsistency of an electric vehicle based on cloud data. Firstly, the characteristic of different charge modes is analyzed, and the charge segment suitable for Incremental Capacity (IC) calculation is screened.

How to evaluate battery pack inconsistency?

In the battery pack inconsistency evaluation process, the weights are allocated by AHP and MSE, respectively, and then the fusion weights are obtained by fusing these two weights. Next, the weights of all the features are combined with the battery cell inconsistency features to evaluate the battery pack inconsistency.

How a large-scale battery energy storage system affects data communication & calculation?

The large-scale battery energy storage system results in the generation of massive data, which brings new challenges in data storage and calculation. BMS has been unable to meet the data communication and calculation in such a scenario.

Series and parallel connected cells also experience different production and operational conditions, which makes it challenging for the BMS to ensure the safe operation of each individual cell.
