What is a battery liquid cooling system?

A battery liquid cooling system for electrochemical energy storage stations that improves cooling efficiency, reduces space requirements, and allows flexible cooling power adjustment. The system uses a battery cooling plate, heat exchange plates, dense finned radiators, a liquid pump, and a controller.

What is a cold plate?

These cold plates have the advantage that there are no thermal boundaries and the aluminium plate has had no thermal stress during the manufacturing process so flatness is easier to achieve. FSW Friction stir welded (Liquid cold plate) This is a two piece construction. The liquid flow path is CNC machined into the base.

How does a liquid cooling plate work?

The liquid cooling plates have internal channels connected to inlet and outlet headers. Coolant flows through the channels and exchanges heat with the batteries. Air flows through separate channels between the batteries and plates. This allows simultaneous cooling of both battery surfaces and the tabs using both air and liquid.
