

The latest advancement of fiber-shaped dye-sensitized solar cells will be introduced in this chapter. The mainstream configurations of fiber-shaped dye-sensitized solar cells, including coaxial and twisting structures, are first illustrated, focusing on the materials, fabrication technique, and performance optimization.

The human habit of wearing fiber materials and interwoven fabric can be dated back to the prehistoric time. In recent years, efforts have been devoted to make flexible energy devices, e.g., solar cells, into fiber shape, further expanding the concept of fiber from cloth materials to modern on-body electronic devices.

The fiber-shaped perovskite solar cell (FPSC) is one very important type of these architectures, as it could be a potential power source of portable/wearable electronics. For the first time, we introduce lead acetate as the lead source to ...

Fiber solar cells surpass both the efficiency and functionality of traditional flat-panel solar cells. A hybrid solar energy cell device manufactured from this new optical fiber consists of three or four layers of materials, including a ...

It discusses the rational design of fiber solar cell materials, electrodes and devices, as well as critical factors including cost, efficiency, flexibility and stability . Furthermore, it addresses fundamental theoretical principles and novel ...

Perovskite solar cells in a fiber format have great potential for wearable electronics due to their excellent flexibility, efficient light harvesting, and potentially high power conversion efficiency (PCE). However, the fabrication of large-sized fiber perovskite solar cells (FPSCs) while maintaining high efficiency remains a major challenge because of the difficulty ...

The domain of fiber solar cells remains under-explored in terms of system integration methodologies and the design of external circuitry, indicating a substantial research gap that requires attention. CRediT authorship contribution statement. Ya Liu: Conceptualization, Investigation, Writing ...

The as-fabricated fiber PSC can be easily woven into various flexible structures such as fabrics without the necessity for sealing that is required for fiber dye-sensitized solar cells (Fig. 5.9a, b). Weaving into the fabric is an effective strategy to integrate PSC units into a tandem device.

Fiber-shaped solar cells have aroused intensive attention both academically and industrially due to their light weight, flexibility, weavability and wearability. However, low power conversion efficiencies have largely limited their ...

Flexible fiber/wire-shaped solar cells are a kind of photovoltaic cell fabricated on wire-like substrates. Fiber-type devices, including inorganic, organic, dye-sensitized and perovskite solar cells, have made great progress ...

Compared with metal wires, aligned CNT fibers are more promising candidate serving as cathode or photoanode for wearable fiber-shaped solar cells, such as dye-sensitized ...

Fiber solar cells also require less surface area than planar cells, as the long lengths of the fibers can be embedded into the structure of buildings, like electrical wiring.

An organic solar cell fiber using the common conjugated polymer poly(3-hexylthiophene) (P3HT) and fullerene derivative phenyl-C 61-butyric acid methyl ester (PCBM) was presented by (Zhang et al 2014) built on a titanium wire electrode, stranded with a CNT fiber counter electrode. One thing these approaches have in common is a metal- or carbon-based ...

The materials and structures of fiber-shaped perovskite solar cells are first introduced, focusing on the charge transport and separation process. The realization of stretchable fiber perovskite solar cells is then presented through a delicate structure design.

At present, the global photovoltaic (PV) market is dominated by crystalline silicon (c-Si) solar cell technology, and silicon heterojunction solar (SHJ) cells have been developed rapidly after the concept was proposed, ...

The proposed conception of "solar cells in a fiber form" laid the foundation of the fiber DSC and paved the first stepping-stone toward its application on wearable electronic devices. More important, this visionary work has inspired scientists that the probable approach toward high performance is to develop the competent fiber electrode.
