Can a negative electrode material be used for Li-ion batteries?

We have developed a method which is adaptable and straightforward for the production of a negative electrode material based on Si/carbon nanotube (Si/CNTs) composite for Li-ion batteries.

What are negative electrode materials?

Various negative electrode materials were reported to date, such as  $\text{LiV}_3\text{O}_8$ ,  $\text{TiP}_2\text{O}_7$ ,  $\text{LiTi}_2(\text{PO}_4)_3$ , polyaniline, polyimide,  $\text{MoO}_3$  coated with polypyrrole, and poly (naphthalene four formyl ethylenediamine). Nevertheless, they demonstrated specific energy density lower than  $100 \text{ Wh kg}^{-1}$  and very poor cycling stabilities (7, 9 - 15).

How was the electrochemical test performed in a lithium ion battery?

The electrochemical test was performed in the split cell that was kept inside the glove box that is filled with argon and has low oxygen and moisture levels (less than 0.1 ppm). Si/CNT nano-network coated on a copper substrate served as the negative electrode in the Li-ion battery.

Are negative electrode materials suitable for aqueous LIBs?

In this study, a class of negative electrode materials exhibiting high capacity and high durability (i.e., a metastable and nanosize molybdenum oxide with a rock-salt structure) is proposed for aqueous LIBs.

What are battery electrode materials?

Battery electrode materials tend to be a form of lithium-based metal oxide and are often semiconductors. Field evaporation process models were developed mainly for metals, but in the application of APT to less conductive materials, the difference in regime must be accounted for.

What is the difference between a negative electrode and a conventional electrode?

In contrast, the choice of negative electrode materials is limited, and the hydrogen evolution reaction cannot be easily avoided at the surfaces of conventional negative electrode materials (e.g., graphite used for commercial LIBs).
