

What are film capacitors used for?

Film capacitors are widely used in power electronics applications including but not limited to DC Link, DC output filtering, and as IGBT snubbers.

Why are film capacitors used in DC filtering?

Film capacitors are widely used for DC filtering in power supplies. Their function is to smooth out the DC voltage waveform after rectification. As with all switching devices, IGBTs are subjected to voltage transients during turn-on operation. Voltage transients result from energy trapped in the circuit's stray inductance.

How do I choose the right capacitor for my application?

Ensure you are using the right capacitor type for your application. Please refer to the EPCOS product catalog and application notes for proper selection of capacitors. Please contact EPCOS for any assistance required in selection. Maintain good, effective grounding of capacitor enclosures.

How do you maintain a capacitor enclosure?

Maintain good, effective grounding of capacitor enclosures. Provide the means to isolate any faulty units/banks in the system. Handle capacitor units carefully, as they may be charged even after disconnection due to faulty discharging devices. Follow proper engineering practices.

What is the maximum casing temperature for a polypropylene capacitor?

The maximum casing temperature of 60 °C must not be exceeded. Temperature is one of the main stress factors for polypropylene type capacitors. Temperature has a major influence on the useful life expectancy of the capacitor. Caution! Exceeding the maximum allowed temperature may set the safety device out of operation.

What is a metallized capacitor?

Metallized capacitors use a thin layer of vapor deposited aluminum, zinc or alloy (aluminum/zinc) blend as the electrode system. The metallized layer is only hundreds of angstroms thick, so it takes up little space in the capacitor winding relative to the dielectric thickness, measured in microns.

Make sure that sufficient cooling space is provided (see Figure 2): A minimum distance of 20 mm between the capacitors is necessary to maintain sufficient cooling. Keep at least 20 mm space ...

Gold passivated film caps are out there to feed the audiophile crowd, but even then, those things are very well marked as gold foil caps, with the various trade names. As for me, I'm a retired Navy avionics tech, and now 8 years along in the sourcing department for a passive electronics components distributor.
