

How many years can a smart capacitor last

How long DO AC capacitors last?

The life expectancy of an A/C capacitor varies with the climate and usage pattern, but a typical rating is about six years. Do capacitors have a long lasting life? The current aluminum electrolytic capacitors shelf life is approximately 2 years. If storing these capacitors at a high temperature rating, it can degrade the sealing material.

How long do electrolytic capacitors last?

The shelf life depends on storage conditions. Temperature, atmospheric pressure and humidity. Electrolytic capacitors are most susceptible to high temperatures. The current aluminum electrolytic capacitors shelf life is approximately 2 years. If storing these capacitors at a high temperature rating, it can degrade the sealing material.

How long does a capacitor last at 105°C?

For every 10°C increase in temperature, the reaction rate doubles. That means that for every 10°C decrease in temperature, the lifetime doubles, so a capacitor rated at 5,000 hours at 105°C would have a service life of 10,000 hours at 95°C and 20,000 hours at 85°C.

How long does a ceramic capacitor last?

The shelf life of ceramic capacitors is greatly determined by method of packaging and storage conditions. Unlike aluminum electrolytic capacitors, the dielectric material of multilayer ceramic capacitors (MLCCs) does not exhibit failures when the capacitor is stored for a short period of time.

How to calculate lifetime of electrolytic capacitors?

The lifetime of electrolytic capacitors can be calculated from the following expression: $\text{Life}_{\text{actual}} = \text{Life}_{\text{base}} \times \text{Temperature factor} \times \text{Voltage Factor} \times \text{Current Factor}$. $\text{Life}_{\text{actual}}$ and $\text{Life}_{\text{base}}$ are the life expectancy at the operating and rated temperature, voltage, and current respectively. $20.1^{(T_m - T_c)}$ is the temperature factor.

What affects the shelf life of a capacitor?

Subjecting capacitors to harsh conditions can significantly affect their electrical properties, or even damage them completely. The effect of environmental factors on the shelf life of capacitors varies depending on the chemical composition and construction of a capacitor.

Electrolytic capacitors tend to last a long time. I'd expect more than 10 years. I have some electronics a lot older than that! The capacitance may drop over time but ...
