

When should you remove a battery from the load?

When the batteries are often fully discharged, their lives will be shortened and destroyed in a few weeks. Therefore, when your battery is weak or needs recharging it is best to remove your battery from the load. So today we are going to discuss "Low Battery Voltage Cutoff OR Disconnect Circuit".

Do I need to disconnect the load during charging?

Saw no need to disconnect the load during charging. Even if the charger didn't have enough output to power the radio, it would charge when the radio was off. OK, your application is a little different. Still, if you disconnect the load when the robot docks then how do you reconnect the load without having to do something manually?

Can a relay disconnect a motor from a battery?

Assume that the load is a simple motor, can you please design a circuit with the use of a relay which disconnects the motor from the battery while being charged. If you are controlling the motor anyway, just do not turn it on. It will be disconnected from the battery.

Should a battery charging IC separate a load?

In fact, a battery charging IC that separates the load like this is preferred, since it can accurately determine the charging current and cut off charging at an appropriate level. A system that charges the battery while running off the battery risks overcharging when the current drawn by the load exceeds the end-of-charge current.

What happens if a circuit is disconnected?

Having the circuit disconnected means it relies on you manually putting it in the charger and removing it, so why not have a plug in battery that you unplug from the circuit and plug it into the charger. Disconnected! Edit... How about a barrel jack and use the built in switch contact to disconnect the circuitry -Ve line.

What happens if you charge a battery while running off the battery?

A system that charges the battery while running off the battery risks overcharging when the current drawn by the load exceeds the end-of-charge current. Then you're dependent on the backup timer to reduce battery damage due to overcharging.

The other input is fed from your battery via another potential divider. Set this 2nd potential divider to produce 5V when the battery is 11 volts. The output of the comparator will switch as the battery falls below 11 volts and ...
