

What is battery capacity testing?

Also known as load testing, or discharge testing, capacity testing is a dynamic test whereby a simulated load (in amperes or watts) is imposed on the battery system for a specified time. The discharge continues to a defined end-of-discharge (EOD) voltage, referencing a measured battery temperature taken at the start of the test.

How do you test a battery capacity?

By measuring the voltage across the battery, its remaining capacity can be preliminarily estimated. The constant current discharge method is a more accurate battery capacity test method. Connect the battery to a certain load and discharge it at a constant current until the battery voltage drops to the predetermined cut-off voltage.

How do you know if a battery has a capacity?

The capacity corrected to 25°C is 88.7% and the battery passed the test. Failure to use K_t results in a capacity calculation of 96.7%, an error of 8%. The only way to know the capacity of a battery is to perform a capacity test under specific test conditions. Tests should be conducted periodically based on the applicable IEEE recommended practice.

How many volts does a battery test take?

When the test time reaches three hours, the battery voltage would be 105V for a capacity of 100%. Test results frequently result in a capacity of more than 100%, which is why it is important the test be run to the EOD voltage rather than terminating the test at 100% capacity.

How to calculate battery capacity?

By measuring the discharge time and combining the current value, the battery capacity can be accurately calculated. This method is relatively simple to operate and the results are relatively reliable, but it requires certain experimental equipment and technical support. 3. Pulse discharge method: a fast and accurate modern technology

How to test a battery?

Here, we'll focus on three easy methods: using constant-current, constant-power, and with the help of commercial testers. This test subjects the battery to a discharge cycle at a constant current. It works well when checking smaller batteries (takes less time) and requires a constant current load. It's also advisable to use a 0.5C discharge rate.
