

What are lithium-ion batteries used in space?

GS Yuasa Technology Ltd's lithium-ion cells, used in space, have optimal design for ISS operations, which require highly efficient charging and discharging. Developed and manufactured by GS Yuasa Technology Ltd, these batteries help to power Japanese H-IIA rockets into space, boasting high energy density and long life.

What is a commercial lithium ion battery (LIB)?

Commercial LIBs mainly use graphite or mesocarbon microbeads (MCMB) as the anode material. Although they have several advantages and widely used in many portable electronic devices, lithium deposition on this material at high current rates leads to safety problem.

Can lithium-ion batteries be recycled?

At end of life, lithium-ion batteries should be recycled. They contain no controlled toxic materials such as cadmium, mercury and lead. Lithium-ion batteries operate based on the same principles as any other rechargeable battery. During discharge, electrical charge moves through an external wire circuit between the electrodes of the battery.

What are GS Yuasa lithium-ion batteries used for?

GS Yuasa lithium-ion batteries are used to power electronic devices on-board Japanese H-IIA rockets. Developed together with Mitsubishi Heavy Industries, these batteries help to launch the rockets into space.

What is a primary battery?

Primary batteries are a class of batteries in which the electrochemical reactions of the active materials are not reversible and hence they are designed to use for a single discharge and discarded. These batteries are usually cheap and easy to handle.

What are the main components of a lithium ion battery?

Like any type of battery, LIBs have three main components; cathode, anode and electrolyte. The basic principle of operation of LIBs is presented in Fig. 1.2. The cathode material in commercial LIBs is a layered oxide,  $\text{LiCoO}_2$  while graphite is the widely used anode material.
