

Does a phone have a removable battery?

Has a removable battery! Phones with a removable battery are a dying breed these days. Manufacturers have moved to unibody, sealed designs for affordable and flagship phones. It's a pity, because a removable battery allows you to swap out batteries easily -- that means no time lost charging, and you can quickly ditch degraded batteries.

What is the difference between a removable battery and a non-removable battery?

The difference between the two is very simple. Removable batteries can be taken out of the phone, usually by opening up the back plate and taking it out. Non-removable batteries will be encased within the phone's vital components. It'll be hard, if not impossible, to remove the battery without first tampering with very important parts of the phone.

Why do you need a removable battery?

Removable batteries are helpful for being able to quickly reset your phone (either through replacing the battery or restarting it), for swapping out batteries yourself rather than paying a manufacturer to do it for you, and for avoiding buying a new handset if the battery dies.

Should you buy a removable battery?

Manufacturers have moved to unibody, sealed designs for affordable and flagship phones. It's a pity, because a removable battery allows you to swap out batteries easily -- that means no time lost charging, and you can quickly ditch degraded batteries. There is a sign of good things to come for removable battery lovers, though.

Why do phones not have removable batteries?

Well, there are a variety of factors behind manufacturers' insistence on not having removable batteries on their phones. First and foremost, removable batteries are somewhat limited in their functionality. By this, we mean that removable battery will come in the way of some essential features like water-resistance, slim design, etc.
