Can lead-acid battery chemistry be used for energy storage?

Abstract: This paper discusses new developments in lead-acid battery chemistry and the importance of the system approach for implementation of battery energy storage for renewable energy and grid applications.

Can lead batteries be used for energy storage?

Lead batteries are very well established both for automotive and industrial applications and have been successfully applied for utility energy storage but there are a range of competing technologies including Li-ion, sodium-sulfur and flow batteries that are used for energy storage.

What is a lead acid battery used for?

Batteries of lead-acid are extensively used in diverse applications like automotive industries, telecommunications systems, hospitals, emergency lighting, power tools, alarm systems, material handling, railway air-conditioning and coach lighting, and so on.

Does stationary energy storage make a difference in lead-acid batteries?

Currently, stationary energy-storage only accounts for a tiny fraction of the total sales of lead-acid batteries. Indeed the total installed capacity for stationary applications of lead-acid in 2010 (35 MW) was dwarfed by the installed capacity of sodium-sulfur batteries (315 MW), see Figure 13.13.

Are lead batteries sustainable?

Improvements to lead battery technology have increased cycle life both in deep and shallow cycle applications. Li-ion and other battery types used for energy storage will be discussed to show that lead batteries are technically and economically effective. The sustainability of lead batteries is superior to other battery types.
