

Are lead halide perovskite solar cells sustainable?

Sustainability of lead halide perovskite solar cells Though the lead toxicity exists in most of highly-efficient perovskite cells so far, the use of lead halide perovskite can hardly affect the environment and health fortunately with the development of ECR (encapsulate, capture, and recycle) technology.

Can lead-based perovskites be used for solar cells?

Lead-based perovskites are emerging as a new material for the next generation of solar cells for large-scale energy production. Here, we provide our perspective on commercializing solar cells based on perovskites containing lead.

Why do solar cells use organic-inorganic lead halide perovskites as absorbers?

1. Introduction Solar cells using organic-inorganic lead halide perovskites as absorbers have attracted world-wide attention due to the impressive power conversion efficiency (PCE) and low-temperature solution-processable fabrication.

What are hybrid lead perovskites?

Hybrid lead perovskites containing a mixture of organic and inorganic cations and anions have led to solar cell devices with performance and stability that are better than those of their single-hal...

Is lead toxicity hindering the commercialization of perovskite solar cells?

Lead toxicity of perovskite solar cells is hindering their commercialization, as lead is currently indispensable in making high-performance perovskite solar cells. Here the authors propose a new strategy to address this issue while simultaneously improving the stability and reproducibility of perovskite solar cells.

Can a solar cell encapsulate a leaking perovskite?

Meanwhile, some substances that can chelate lead ions can also be used as encapsulation layers to capture lead leaking from damaged perovskite equipment. Recycling damaged or discarded solar cells can not only prevent lead from polluting the environment, but also save costs and shorten the energy payback time.

This potentially limits single-junction solar cell efficiency but is advantageous for perovskite-perovskite tandem cells and radiation detection [153, 154]. Lead-tin double perovskites are ...

Introduction Hybrid perovskite solar cells have caused a stunning revolution in PVs, with efficiency rising from 4 to 25.5% in just over a decade, while it took more than 40 years for CdTe and CIGS to achieve the same improvement. 1,2 Common lead-based hybrid perovskites rely on the  $APbX_3$  structure, where A is an organic or inorganic cation (e.g. methylammonium, formamidinium ...

Tin-lead alloyed perovskite (TLP) materials, along with all-perovskite tandem solar cells, have gained

increasing attention and demonstrated significant advancements recently. With these trends, this review provides a comprehensive overview of recent advancements in TLPs for photovoltaic applications, covering ionic compositions, crystallization engineering, ...

Lead halide perovskite solar cells (PSCs) have emerged as a highly promising next-generation photovoltaic ... [49, 52] After 60 s, we observe a steady increase in the Pb ...

Metal halide perovskite solar cells (PSCs) show great promise in the photovoltaic field due to their tunable bandgap, high extinction coefficient, small exciton binding ...

Astonishing progress on the stability and performance of lead halide perovskite solar cells (PSCs) has been achieved in the past few years. However, the presence of toxic lead in the perovskite ...

Lead in perovskite solar cells is a potential environmental and health hazard if it is released from accidentally damaged panels. Now, the encapsulation of perovskite solar cells with self-healing ...

the rate at which solar light can be converted into electrical energy, starting from 3.8% in 2009 to 25.5% in 2021 for a single-junction device.<sup>1</sup> Perovskite solar cells (PSCs) with the best PV performance are based on lead (Pb) halide frameworks. Upon exposure to water, the Pb compounds that form, lead dihalides, are sparingly soluble in water ...

Currently, the reported experimental efficiency of Pb-free perovskite cells in the field of HaP solar cells is generally below 15%, and the highest recorded efficiency is shown for FASnI<sub>3</sub> solar cells with 15.7%.<sup>50, 51</sup> The SLME value of the perovskite component predicted by our method is 21.5%, which shows a discrepancy compared to the experimental value.

Tin-based halide perovskite materials have been successfully employed in lead-free perovskite solar cells, but the tendency of these materials to become semi-metallic from p-type defect states ...

Perovskite solar cells" lead toxicity and leakage are key obstacles to commercialization. Here, we introduce a diazapolyoxyamacyclic structure of cryptand 222 (C222) into the perovskite precursor solution to obtain high-quality films. ... (ETL), indicating that PSCs are prone to degradation and release lead-containing products into the ...

A perovskite solar cell. A perovskite solar cell (PSC) is a type of solar cell that includes a perovskite-structured compound, most commonly a hybrid organic-inorganic lead or tin halide-based material as the light-harvesting ...

Hybrid lead perovskites containing a mixture of organic and inorganic cations and anions have led to solar cell devices with performance and stability that are better than ...

Introduction Hybrid perovskite solar cells have caused a stunning revolution in PVs, with efficiency rising from 4 to 25.5% in just over a decade, while it took more than 40 years for CdTe and ...

The fabrication of lead-free perovskite solar cells (PSCs) is environmentally acceptable; researchers have investigated the unique perovskite materials that are non-toxic in nature. The ...

Apart from the electron configuration, the facile oxidation of Sn is attributed to the band structure of Sn-containing perovskite (Figure 1c) metal-halide perovskites, the conduction band ...
