

Are lithium-ion batteries a problem?

Due to their exceptional high energy density, lithium-ion batteries are of central importance in many modern electrical devices. A serious limitation, however, is the slow charging rate used to obtain the full capacity. Thus far, there have been no ways to increase the charging rate without losses in energy density and electrochemical performance.

How do photo-assisted rechargeable metal batteries perform?

Apart from the suitable band structure of photocatalyst, the overall performance of photo-assisted rechargeable metal batteries (specific capacity, charge-discharge efficiency and cycling stability, et al.) is influenced by morphological, structural, and electrochemical properties of the cathode, anode and electrolyte.

How does  $\text{LiMn}_2\text{O}_4$  light affect battery charging time?

We find that a direct exposure of light to an operating  $\text{LiMn}_2\text{O}_4$  cathode during charging leads to a remarkable lowering of the battery charging time by a factor of two or more. This enhancement is enabled by the induction of a microsecond long-lived charge separated state, consisting of  $\text{Mn}^{4+}$  (hole) plus electron.

Does white light affect the charging rate of a cathode?

Here we show that the charging rate of a cathode can be dramatically increased via interaction with white light. We find that a direct exposure of light to an operating  $\text{LiMn}_2\text{O}_4$  cathode during charging leads to a remarkable lowering of the battery charging time by a factor of two or more.

Are solar cells suitable for photo-charging lithium-ion batteries?

Solar cells offer an attractive option for directly photo-charging lithium-ion batteries. Here we demonstrate the use of perovskite solar cell packs with four single  $\text{CH}_3\text{NH}_3\text{PbI}_3$  based solar cells connected in series for directly photo-charging lithium-ion batteries assembled with a  $\text{LiFePO}_4$  cathode and a  $\text{Li}_4\text{Ti}_5\text{O}_{12}$  anode.

Can a lithium manganese oxide cathode lead to fast lithium-ion battery charging?

Here the authors show that illumination of a lithium manganese oxide cathode can induce efficient charge-separation and electron transfer processes, thus giving rise to a new type of fast lithium-ion battery charging.

How the memory effect arises: The "memory" effect of the battery is "written" in a cycle with partial charging (here, 50 percent of the battery's storage capacity) followed ...

Pushing it faster could result in a buildup of lithium metal on the battery electrodes, which could pose a safety hazard. Now, researchers have developed a way to see a three-dimensional picture of what's happening ...

The evolution of the battery-charging current was studied to determine the exact effect of the C-rate on battery-charging behavior. Fig. 2 (a) shows the battery current variations at different C-rates during one charging test at 25 °C. When the battery was charged at 1 C, the battery current curve first demonstrated CC, and then the battery ...

The photo-enhanced rechargeable Li-O<sub>2</sub> batteries: (a) Schematic diagram and (b) the charging curves of the Li-O<sub>2</sub> battery with/ without redox shuttle at a current density of 0.016 mA cm<sup>-2</sup> and 0.032 mA cm<sup>-2</sup> [29]., (c) Diagram of photo-assisted rechargeable Li-O<sub>2</sub> battery consists of Li anode, I-ion redox mediator and C<sub>3</sub>N<sub>4</sub> grown on carbon paper as ...

Electrode stress significantly impacts the lifespan of lithium batteries. This paper presents a lithium-ion battery model with three-dimensional homogeneous spherical electrode particles. It utilizes electrochemical and mechanical coupled physical fields to analyze the effects of operational factors such as charge and discharge depth, charge and discharge rate, and ...

This paper studies a commercial 18650 NCM lithium-ion battery and proposes a universal thermal regulation fast charging strategy that balances battery aging and charging time. An electrochemical coupling model considering temperature effects was built to determine the relationship between the allowable charging rate of the battery and both temperature and SOC ...
