Can ferrite nanoparticles be used for power inductors?

Ferrite nanoparticles: potential soft magnetic materials for power inductors Since the magnetic nanoparticles are promising for fabricating inductors with low loss, high flux at elevated temperature and broadband applications, ferrite nanoparticles also attract much interest.

How to miniaturize the terminal products of power inductors?

In addition, to miniaturize the terminal products, the power inductors should also have small size, which also puts more requirements on the soft magnetic materials in the inductors. At present, the soft magnetic materials for power inductor mainly include soft ferrites and soft magnetic metals or alloys (Fig. 1 (c)).

Which soft magnetic materials are suitable for low-end inductors?

Several typical soft magnetic materials and their mechanical properties; the data are extracted from Ref. . Based on the fundamental properties of the soft magnetic materials, Mn-Zn ferrites are suitable for medium- and low-end inductors with low power density and low working temperature. They generally work at frequency < 4 MHz.

How are inductors made?

The inductors made from these powders are mostly made by the powder metallurgy techniques, followed by winding or molding. The metal or alloy powders are mostly coated by electric insulation layer and bonded by polymer or other materials, and this type of soft magnetic core is also called soft magnetic composite (SMC).

What are soft magnetic ferrites & SMCs for power inductors?

Up to now, various soft magnetic ferrites and SMCs have been applied for power inductors. Since the products are usually customized, each soft magnetic material plays its own important role. The ferrites are mainly fabricated as assembled and sealed inductors, which applicable for relatively high frequency and have distinct cost advantage.

What are soft magnetic materials for power inductor?

At present, the soft magnetic materials for power inductor mainly include soft ferrites and soft magnetic metals or alloys (Fig. 1 (c)). The soft magnetic ferrites mainly include Mn-Zn, Ni-Zn, and Ni-Cu-Zn ferrites,
