Cold energy utilization research has focused on improving the efficiency of liquid air production and storage. Studies have shown that leveraging LNG cold energy can reduce specific energy consumption for liquid air production by up to 7.45 %.

What is liquid air energy storage (LAES)?

6. Concluding remarks Liquid air energy storage (LAES) is becoming an attractive thermo-mechanical storage solution for decarbonization, with the advantages of no geological constraints, long lifetime (30-40 years), high energy density (120-200 kWh/m³), environment-friendly and flexible layout.

Why do we use liquids for the cold/heat storage of LAEs?

Liquids for the cold/heat storage of LAES are very popular these years, as the designed temperature or transferred energy can be easily achieved by adjusting the flow rate of liquids, and liquids for energy storage can avoid the exergy destruction inside the rocks.

What is a standalone liquid air energy storage system?

4.1. Standalone liquid air energy storage In the standalone LAES system, the input is only the excess electricity, whereas the output can be the supplied electricity along with the heating or cooling output.

How does liquid air energy storage work?

Enter liquid air energy storage, which has no such geographic restrictions. This works by using electricity during periods of abundant wind and solar generation to clean, dry and refrigerate air until it liquefies. The liquid air is then stored in insulated tanks.
