When will energy storage be commercialized?

From 2016 to 2020, the goal is to build energy storage demonstration projects with commercial purposes. This marks the development of energy storage into the early stages of commercialization. During this period, the management system, incentive policies and business models of energy storage were mainly explored.

Which technologies convert electrical energy to storable energy?

These technologies convert electrical energy to various forms of storable energy. For mechanical storage, we focus on flywheels, pumped hydro, and compressed air energy storage (CAES). Thermal storage refers to molten salt technology. Chemical storage technologies include supercapacitors, batteries, and hydrogen.

What does new energy do?

The diverse New Energy portfolio includes ventures in carbon capture and sequestration, energy storage, geothermal power, geoenergy for heating and cooling, sustainable battery-grade lithium, and hydrogen as an energy carrier.

Who owns the energy storage system?

The grid subsidiary is the owner of the energy storage system. The third type is the third-party investment. Under this investment model, the energy storage system is invested and operated by third parties.

What are business models for energy storage?

Business Models for Energy Storage Rows display market roles, columns reflect types of revenue streams, and boxes specify the business model around an application. Each of the three parameters is useful to systematically differentiate investment opportunities for energy storage in terms of applicable business models.

What is shared energy storage & other energy storage business models?

Through shared energy storage and other energy storage business models, the application scope of energy storage on the power generation side, transmission and distribution side, and user side will be blurred. And many application scenarios can realize the composite utilization of energy storage according to demand.
