

What is battery research?

Battery research occurs throughout the value chain of battery development. It can be oriented toward battery cells, based on competences in chemistry, physics, materials science, modelling, characterization, etc. It can also be oriented toward systems where the battery cells are integrated into packs, to be used in different applications.

Could a new lithium-ion battery make electric cars more sustainable?

MIT researchers have now designed a battery material that could offer a more sustainable way to power electric cars. The new lithium-ion battery includes a cathode based on organic materials, instead of cobalt or nickel (another metal often used in lithium-ion batteries).

Can a new battery material reduce the amount of lithium?

It has been corrected to say that the material can reduce the amount of lithium by as much as 70 percent. We regret the error. Microsoft and the Pacific Northwest National Laboratory used AI and high-performance computing to discover a promising new battery material faster than ever before.

How are batteries recycled?

Currently, pyrometallurgy is the most applied method. After potential dismantling and sorting into categories according to the battery chemistries, the batteries or battery parts are directly fed into the recycling process or further fragmented by physical means (e.g., shredding or grinding).

Are NREL batteries sustainable?

Sustainability is another concern at the forefront for NREL researchers. As such, research teams are prioritizing material and product designs that reduce the use of rare critical materials, such as cobalt, currently used in Li-ion batteries.

Is AI accelerating the search for new battery materials?

Artificial intelligence (AI) and large-scale cloud computing is speeding up the search for new battery materials. An AI-enhanced collaboration between Microsoft and the Pacific Northwest National Laboratory (PNNL) has already produced one promising new material, which the two are sharing publicly today.

MIT engineers designed a battery made from inexpensive, abundant materials, that could provide low-cost backup storage for renewable energy sources. Less expensive ...

BATTERY 2030+ advocates the development of a battery Materials Acceleration Platform (MAP) to reinvent the way we perform battery materials research today. We will achieve this by creating an autonomous, "self-driving" laboratory for ...

The researchers queried AQE for battery materials that use less lithium, and it quickly suggested 32 million different candidates. From there, the AI system had to discern which of those materials ...

We can test new materials and processes in small batches of a few grams up to production runs involving tens of kilograms of material. As part of our battery scale-up pilot line, we have ...

Researchers from the Harvard John A. Paulson School of Engineering and Applied Sciences (SEAS) have developed a new lithium metal battery that can be charged and ...

Researcher at DTU have patented a new superionic material based on potassium silicate - a mineral that can be extracted from ordinary rocks. Go to primary content ...

While the cathode material described in the study could have a transformative impact on lithium-ion battery technology, there are still several avenues for study going forward. Among the areas for future study, Huang says, are efforts to ...

Using a transformative scientific approach to design the material, the interdisciplinary research team from the University synthesised the material in the laboratory, ...

Even after 5,000 charge and discharge cycles, the new material battery still retains 80 percent of its initial capacity. The research also mentioned that the new material ...

The new material, sodium vanadium phosphate with the chemical formula $\text{Na}_x\text{V}_2(\text{PO}_4)_3$, improves sodium-ion battery performance by increasing the energy density -- the ...

Request PDF | The New Material Battery Based on Mg/C-? | Graphene is a 2-dimensional carbon allotrope consisting of a thin layer of sp^2 carbon atoms connected by van der Waals forces. Doping ...

Microsoft researchers used AI and supercomputers to narrow down 32 million potential inorganic materials to 18 promising candidates in less than a week - a screening process that could have taken...

This starts with optimising raw materials, designing for disassembly, reuse and recyclability, and identifying how best to recover the value of these materials when the battery reaches end-of ...

A £29 million investment will boost six innovative projects, four of which involve University of Oxford researchers, that are driving progress towards developing the next ...

The Dutch Research Council advances world-class scientific research with impact ... Next Generation Batteries based on Understanding Materials Interfaces. ... multinationals and ...

A new type of battery, based on a material discovered with the help of AI, is shown being tested in the

laboratory. Dan DeLong/Microsoft
