

Are phase change materials suitable for thermal energy storage?

Volume 2, Issue 8, 18 August 2021, 100540 Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What are phase change materials (PCMs)?

Phase Change Materials (PCMs) are ideal products for thermal management solutions. This is because they store and release thermal energy during the process of melting & freezing (changing from one phase to another). When such a material freezes, it releases large amounts of energy in the form of latent heat of fusion, or energy of crystallisation.

Which phase change materials have enhanced thermophysical properties?

Development of sodium acetate trihydrate-ethylene glycol composite phase change materials with enhanced thermophysical properties for thermal comfort and therapeutic applications Design and preparation of the phase change materials paraffin/porous Al_2O_3 @graphite foams with enhanced heat storage capacity and thermal conductivity ACS Sustain. Chem.

Who is phase change solutions?

Phase Change Solutions is awarded as a 2020 BNEF Pioneer from BloombergNEF, one of ten game-changing companies recognized for their leadership in transformative technologies. Phase Change Solutions ("PCS") is a global leader in the development of temperature control and energy-efficiency solutions utilizing phase change materials ("PCMs").

How much research has been done on phase change materials?

A thorough literature survey on the phase change materials for TES using Web of Science led to more than 4300 research publications on the fundamental science/chemistry of the materials, components, systems, applications, developments and so on, during the past 25 years.

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.
