Is there a framework for low-temperature fast charging of lithium-ion batteries?

A three-electrode battery is constructed for study. A low-temperature charging framework is developed. This paper proposes a novel framework for low-temperature fast charging of lithium-ion batteries (LIBs) without lithium plating. The framework includes three key components: modeling, constraints, and strategy design.

Can lithium-ion batteries be used at low temperatures?

Challenges and limitations of lithium-ion batteries at low temperatures are introduced. Feasible solutions for low-temperature kinetics have been introduced. Battery management of low-temperature lithium-ion batteries is discussed.

Why is lithium plating important for low-temperature batteries?

When the dendritic Li penetrates the separator, it will cause short circuit inside the battery, leading to thermal runaway and explosion [147,148]. Therefore, early detection and prevention of lithium plating is extremely important for low-temperature batteries.

Do lithium-ion batteries deteriorate under low-temperature conditions?

However, commercially available lithium-ion batteries (LIBs) show significant performance degradation under low-temperature (LT) conditions. Broadening the application area of LIBs requires an improvement of their LT characteristics.

Can lithium phosphate batteries be charged at 10 °C?

Lithium dendrites can puncture the separator and lead to internal short circuit, leading to thermal runaway. To prevent lithium plating during low-temperature charging, Ouyang et al. investigated the charging of lithium iron phosphate batteries at -10 °C.

How to prevent lithium plating during low-temperature charging?

To prevent lithium plating during low-temperature charging, Ouyang et al. investigated the charging of lithium iron phosphate batteries at -10 °C. They found that lithium plating can be avoided when the charging rate is below 0.25C and the charging cut-off voltage is less than 3.55 V.

The inner preheating improves the lithium-ion battery's low-temperature discharge capability marginally, as seen in the figure. Under 3.70 W and 5.78 W heating powers, compared with the battery without heating, the low-temperature discharge capacity of the lithium-ion battery is increased by 5.3 % and 1.8 %, respectively. Although inner ...

To address the issues mentioned above, many scholars have carried out corresponding research on promoting the rapid heating strategies of LIB [10], [11], [12]. Generally speaking, low-temperature heating strategies are commonly divided into external, internal, and hybrid heating methods, considering the constant increase of the energy density of power ...

then set low temperature charge cutoff to a battery temperature where that charge current would do no harm. Lithium accepts its maximum charge rate, typically around 0.5C, in the vicinity of ambient 25 degrees C. Down near freezing, max rate for no accelerated degradation is greatly reduced.
