

Previous studies on highly-efficient quantum dot solar cells (QDSCs) focused on traditional chalcogenide colloidal quantum dots (CQDs), such as lead sulfide (PbS) CQDs. 55-58 In the ...

Besides the new photovoltaic (PV) material synthesis and device structure optimization ... Yoo S, Jeon D Y and Kim S O 2013 Exciton dissociation and charge-transport ...

Colloidal quantum-confined semiconductor nanostructures are an emerging class of functional material that are being developed for novel solar energy conversion strategies. ...

Colloidal quantum dot (QD) materials offer unique properties over those afforded by conventional thin films for optoelectronic and other applications. ... which led to the ...

This review aims to compare similarities and differences between lead chalcogenide and lead halide perovskite QDs for photovoltaic applications. The fundamental physical properties of these two types of ...

InP and InZnP colloidal quantum dots (QDs) are promising materials for application in light-emitting devices, transistors, photovoltaics, and photocatalytic cells. In addition to possessing an appropriate bandgap, high absorption ...

Combining Quantum Dot and Perovskite Photovoltaic Cells for Efficient Photon to Electricity Conversion in Energy Storage Devices. Erik M. J. Johansson, ... This is an approximation, since some of this long wave infrared ...

In the context of solar cells, quantum dots are integrated into composite materials, often in the form of thin films or coatings, to create what is known as quantum dot ...

Metal halide perovskite quantum dots (PQDs) not only share the common feature of quantum confinement effect found in traditional quantum dots but also exhibit favorable characteristics of perovskite materials, including ...

CIS (Copper-Indium/Selenide) Copper-indium-selenide (CuInSe_2) is a p-type semiconductor that has drawn tremendous attraction in the field of photovoltaic applications due to its wide ...

Lead halide perovskite quantum dots (PQDs), also called perovskite nanocrystals, are considered as one of the most promising classes of photovoltaic materials for solar cells due to their ...

Quantum dots (QDs) have enticed the researchers, due to their unconventional optical and electronic

characteristics, contributing potentially for several applications such as ...

Near-infrared PbS quantum dots (QDs) composed of earth-abundant elements ² have emerged as promising candidates for photovoltaic applications because of a tunable ...

One of the most promising renewables for energy production and fastest growing markets are solar photovoltaics (PV), which in 2020 grew by 23% and approached 1?000 TWh ...

The quantum dot perovskite materials developed by Luther and the NREL/University of Washington team could be paired with cheap thin-film perovskite materials to achieve similar high efficiency as demonstrated for ...

Due to the ideal band gap and environmental friendliness, InP is a promising light-harvesting material in photovoltaic cells. However, "green" InP based quantum dot ...
