

Reason why the battery cabinet in the high-voltage distribution room is out of power

Why do batteries need to be ventilated?

The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small. However, the concern is elevated during times of heavy recharge or the batteries, which occur immediately following a rapid and deep discharge of the battery.

Do vented lead acid batteries need a separate battery room?

Vented lead acid batteries installed in medium voltage main substation buildings and unit substations, electrical equipment rooms and control system rack rooms shall not require a separate, dedicated battery room and shall be in accordance with SES E14-S02. The battery room and installation shall comply with IEEE 484, NFPA 70 and OSHA 29 CFR.

Should a battery room have a ventilation system?

It is essential that the ventilation system on the outside of such a room is exclusive to the battery room. It is normal practice to provide corrosion-resistant luminaires in battery rooms. Mounting directly over cells is avoided, to prevent accumulation of hydrogen in the luminaire with consequent risk of explosion.

How does a battery room work?

The number of air changes is arranged to dilute the average concentration of hydrogen to less than 1%. The ventilation outlets venting to the open air are at the highest level in the battery room. Ceilings are sloped towards them, to aid the escape of hydrogen.

What causes a battery to dry out?

To prevent the failure and the battery dry out, the safety valves open and the battery vents hydrogen until temperature and/or voltage are reduced. This condition can be triggered by charger over-voltage. Flooded cell batteries are immune to thermal runaway condition.

How should a battery room be designed?

Battery rooms shall be designed with an adequate exhaust system which provides for continuous ventilation of the battery room to prohibit the build-up of potentially explosive hydrogen gas. During normal operations, off gassing of the batteries is relatively small.

the 12V DC net from the high voltage net and up to the energy distribution within the DC high voltage net. Up to now, separate high-voltage power electronics were integrated for the individual tasks of charging and conversion/inversion: An onboard charger (OBC) handles the AC charging of the high voltage battery,

From the above content, power transmission at high voltage can result in a reduction in power loss and conductor cost, hence improve the efficiency of power transmission. In short, transmission of power at high voltages can help achieving lesser power loss, lesser voltage drops and at the same time improves system efficiency and reduces overall cost of power transmission.
