

# Reasons for the shortage of main battery materials

How can EV battery shortages be prevented?

This article focuses on three key measures for preventing or responding to EV battery shortages: industrialization and scale-up of gigafactories, strategies to find and retain talent, and establishment of a robust and efficient supply chain.

How will the battery supply chain affect the future?

In fact, the battery supply chain risks facing a situation similar to the current semiconductor chip shortage, where demand growth has outstripped capital investment in new supply. Furthermore, environmental, social, and governance (ESG) factors will play a more significant role--raising another set of issues that companies need to address.

What challenges will the battery supply chain face in 2030?

All aspects of the battery value chain are expected to grow rapidly through 2030, with cell production and material extraction being the largest markets (Exhibit 2). That growth will likely create ongoing supply chain challenges.

What are the challenges faced by the battery industry?

Short- to midterm challenges, such as price volatility and materials shortages at a regional level, will likely continue. In addition, serious sustainability challenges concerning emissions and other environmental and social effects of battery materials and battery disposal are emerging.

Can the EV battery supply chain meet increasing demand?

Concerns about the EV battery supply chain's ability to meet increasing demand. Although there is sufficient planned manufacturing capacity, the supply chain is currently vulnerable to shortages and disruption due to ge

How will supply chain disruptions affect lithium-ion batteries in 2021?

And recent supply chain disruptions have significantly increased the price of key materials by more than 20 percent, which caused the costs of lithium-ion batteries to increase in 2021--the first time in many years. In the longer term, geopolitical and labor constraints will likely constrain material supplies.

Explore eight essential raw materials in shortage for 2024, affecting supply chain security across industries. Learn how to mitigate risks & ensure resilience. ... The change in demand, with battery makers choosing options like lithium iron ...

Understanding constraints within the raw battery material supply chain is essential for making informed decisions that will ensure the battery industry's future success. The primary limiting factor for long-term mass production of batteries is mineral extraction constraints. These constraints are highlighted in a first-fill

## Reasons for the shortage of main battery materials

analysis which showed significant risks if lithium ...

The high demand for equipment and installation materials, as a result of the return to normality after the pandemic, has left an uncertain outlook for manufacturers and suppliers in the sector, as the supply begins to decline, prices increase, and all as a result of the shortage of raw materials. A shortage of raw materials, semiconductors ...

Li-ion batteries have an unmatched combination of high energy and power density, making it the technology of choice for portable electronics, power tools, and hybrid/full electric vehicles [1]. If electric vehicles (EVs) replace the majority of gasoline powered transportation, Li-ion batteries will significantly reduce greenhouse gas emissions [2].

The primary issue is the potential for skyrocketing costs of the base materials found within lithium-ion batteries, a value that has been rapidly increasing in recent years as the technology has become smarter and less of a rarity.

The world is currently facing a shortage of raw materials for a whole range of reasons, as countries slowly recover from the pandemic and grapple with

concerns about the EV battery supply chain's ability to meet increasing demand. Although there is sufficient planned manufacturing capacity, the supply chain is currently vulnerable to shortages ...

This allows the country to lead again this race in the battery industry, being currently the leading country in the mining industry for raw materials for the battery sector. To prove it, here is a shattering fact: only in ...

Photo: Nth Cycle The global shift to electric vehicles (EVs) is accelerating, but a recent report by McKinsey warns of major difficulties in the supply chain of key battery components by 2030.

The pandemic-triggered economic slowdown was one of the main causes of the 2021-2022 Global Supply Chain Crisis which disrupted the global food production systems. Another example is the impact of the 2021 ...

Battery manufacturers are challenged by an ongoing shortage of raw materials because of the increased demand for battery-powered devices as well as the complexity of the global supply chain. For example, critical ...

The main reason for the scarcity of raw materials is the low number of suppliers. China accounts for 75% of all battery production globally and for almost 80% of the refining capacity for rare minerals for EV production. The dominance of China won't provide a ...

## Reasons for the shortage of main battery materials

New battery materials must simultaneously fulfil several criteria: long lifespan, low cost, long autonomy, very good safety performance, and high power and energy density. Another important criterion when selecting new materials is their environmental impact and sustainability. To minimize the environmental impact, the material should be easy to recycle and re-use, and be ...

And those materials are not Made in the USA. In 2020, the US imported over half of its supply of 46 minerals and all its supply of 17, according to the US Geological Survey. One of the biggest suppliers is China--the world leader in lithium-ion battery manufacturing--which has a history of restricting trade for political reasons.

An exponential increase in EV sales could use almost the entire available supply of lithium by 2030 without alternate battery chemistries or more reuse and recycling.

And those materials are not Made in the USA. In 2020, the US imported over half of its supply of 46 minerals and all its supply of 17, according to the US Geological Survey. One of the biggest suppliers is China--the world ...
