

Small liquid-cooled energy storage can store electricity

What is a liquid air energy storage system?

An alternative to those systems is represented by the liquid air energy storage (LAES) system that uses liquid air as the storage medium. LAES is based on the concept that air at ambient pressure can be liquefied at -196°C , reducing thus its specific volume of around 700 times, and can be stored in unpressurized vessels.

Can liquid air energy storage be commercially feasible?

In order to be commercially feasible liquid air energy storage needs to have efficiencies to rival battery storage. To achieve this, liquid air energy storage plants recycle the waste cold that results from the discharge stage, to help cool incoming air when charging.

How is solar energy stored?

The heat from solar energy can be stored by sensible energy storage materials (i.e., thermal oil) and thermochemical energy storage materials (i.e., $\text{CO}_3\text{O}_4/\text{CoO}$) for heating the inlet air of turbines during the discharging cycle of LAES, while the heat from solar energy was directly utilized for heating air in the work of .

Why do we use liquids for the cold/heat storage of LAEs?

Liquids for the cold/heat storage of LAES are very popular these years, as the designed temperature or transferred energy can be easily achieved by adjusting the flow rate of liquids, and liquids for energy storage can avoid the exergy destruction inside the rocks.

What is a large-scale energy storage system (LAES)?

Indeed, characterized by one of the highest volumetric energy density ($\sim 200 \text{ kWh/m}^3$), LAES can overcome the geographical constraints from which the actual mature large-scale electrical energy storage technologies suffer from. LAES is based on the concept that air can be liquefied, stored, and used at a later time to produce electricity.

What is the exergy efficiency of liquid air storage?

The liquid air storage section and the liquid air release section showed an exergy efficiency of 94.2% and 61.1%, respectively. In the system proposed, part of the cold energy released from the LNG was still wasted to the environment.
