

What types of electric motors are used in solar power applications?

There are four basic types of electric motors used in solar power applications: AC induction, stepper, and permanent magnet DC brushed and brushless. Jonathan Doyle, Application Engineer with Dunkermotor, shared some insight into motors and drives in solar applications.

How do you choose a solar motor?

Jonathan Doyle, Application Engineer with Dunkermotor, shared some insight into motors and drives in solar applications. Doyle says choosing a motor depends on the speed, torque and power requirements of the application as well as the communication and drive options required.

How does a solar motor work?

The body of the solar motor is a 12-sided cylinder which has solar cells on each of its 12 side plates. Inside the body, there are six solenoids which are supplied with power generated by the solar cells. For every winding, two opposite solar cell rows are connected in parallel.

How much power does a solar motor use?

Solar motors move large, heavy objects at a slow pace, so they may require as little as one to ten watts of output power during normal operations. Therefore, Doyle reports seeing high gear reduction in motors to primarily reduce tracking speed. The ratio is also needed to allow for the possibility of extremely high wind loading.

What is a solar powered DC motor used for?

Solar-powered DC motors can be used in a variety of advanced applications: Solar-Powered Water Pumps: Used in irrigation and water supply systems, especially in remote areas. Solar-Powered Fans and Ventilation Systems: Ideal for off-grid cooling and ventilation solutions.

Can solar powered motors be used in industrial machines?

Such solar-powered motors could someday be used in industrial machines, household appliances, and even electric cars. Bismit Mohanty, the lead author on the study, says the focus of the model was on boosting the overall efficiency of the system, to obtain the highest output of the motor for the solar power available.
