

What is the working principle of a photovoltaic cell?

Working principle of Photovoltaic Cell is similar to that of a diode. In PV cell, when light whose energy ($h\nu$) is greater than the band gap of the semiconductor used, the light get trapped and used to produce current.

How does a photovoltaic cell work?

Photovoltaic Cell Defined: A photovoltaic cell, also known as a solar cell, is defined as a device that converts light into electricity using the photovoltaic effect. **Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor.

What is the working principle of a solar cell?

Working Principle: The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor. **Role of Semiconductors:** Semiconductors like silicon are crucial because their properties can be modified to create free electrons or holes that carry electric current.

What is a solar cell & a photovoltaic cell?

Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.

How do photovoltaic cells convert sunlight into electricity?

Photovoltaic cells commonly known as solar panels, convert sunlight directly into electricity by utilizing the photoelectric effect. These cells are typically made of semiconductor materials, such as silicon, which release electrons when exposed to sunlight.

What is solar power & how does it work?

While individual solar cells can be used directly in certain devices, solar power is usually generated using solar modules (also called solar panels or photovoltaic panels), which contain multiple photovoltaic cells. Such a module protects the cells, makes them easier to handle and install, and usually has a single electrical output.
